Appendix 4. List of Dangerous Waste in Hospitals/Air Pollutants

Appendix 5. Biomedical Regulations

Appendix 6. Biography

Appendix 7. Glossary

This guide is a product of the Washington State Department of Ecology (Ecology) Best Management Practices (BMPs) for Hospitals Project and financially supported by the Spokane Aquifer Joint Board and Ecology. The project is part of Ecology's Mercury Action Plan to eliminate mercury use in the state of Washington.

Goals of Ecology's Mercury Action Plan include:

- Mercury-free hospitals,
- Protecting groundwater and drinking water sources,
- Encouraging implementation of pollution prevention alternatives,
- Reducing the use of toxic substances and generation of dangerous wastes,
- Improving dangerous (hazardous) waste management practices, and
- Increasing regulatory compliance through technical assistance.

This guide suggests ideas and steps you can take to manage wastes generated in your hospital properly. Hospitals can generate large amounts of dangerous (hazardous) wastes. If not managed properly, dangerous waste can pose threats to your safety, and public safety, and can damage the environment. Proper management of chemicals and wastes can help prevent serious consequences of catastrophic events or accidents. Your hospital is most likely already doing some, but not all, of the best management practices suggested in this guide.

Inside this guide you will find:

- An introduction to environmental waste management concerns in hospitals
- A hospital Self-Audit Form to copy and use in each department
- A page of best management practices and information about toxic substance substitution and waste minimization, for each specific department
- Other guidance documents, pertinent to hospital waste management
- A list of pollution prevention vendors
- A list of resources
- A list of dangerous wastes often found in hospitals
- Biomedical regulations
- A bibliography of publications and resources used to write this publication
- A glossary of terms and acronyms used in this guide.

The information in this guide is not complete and does not address all of the hazards associated with handling chemicals and dangerous waste. For more information about the hazards of chemicals, contact a chemical manufacturer or supplier, the American Chemical Society, a qualified consultant, or an appropriate government agency. Do not consider information provided about vendors or product suppliers as an endorsement by Ecology. Contact Ecology's Hazardous Waste and Toxics Reduction Program for technical assistance at your nearest regional office.

If you have any questions regarding this publication, please contact: Camille Martin (509) 329-3551, or Terri Miller (509) 329-3476.

Chapter 1

Environmental Management

■ Dangerous Waste	1
■ Getting Started	1
■ Dangerous Waste Management	4
■ Air Quality	7
■ Spills	7
■ Underground Storage Tanks	7
■ Solid Waste Management	7
■ Biomedical Waste Management	8
■ Emergency Planning and Community Right-to-Know Act (EPCRA)	8

This section discusses Ecology's environmental management concerns in hospitals. The focus of this section is to address proper management of dangerous waste in hospitals, but some of the concerns affecting water quality are included in this section as well. There are also brief summaries of other environmental concerns such as solid waste, air quality, spills, and underground storage tanks.

Dangerous Waste (also known as “Hazardous Waste”)

The *Dangerous Waste Regulations*, Chapter 173-303 WAC, address designating wastes, generator status, counting your wastes, satellite accumulation requirements, and treating wastes. We encourage your hospital to keep a copy of the *Dangerous Waste Regulations* at your facility. You can order a copy by calling (360) 407-6752 or download a copy from <http://www.ecy.wa.gov/pubs/9291.pdf>

For your convenience, the following Ecology publications have been included in Appendix A:

- Designating Dangerous Waste (Publication # 96-436)
- Counting Dangerous Waste Under the *Dangerous Waste Regulations* (#98-414)
- Satellite Accumulation (#94-120)
- Treatment by Generator (#96-412)
- Universal Waste Rule for Dangerous Waste Lamps (#00-04-020)
- Universal Waste Rule for Batteries and Mercury-Containing Thermostats (98-407)
- Focus on Pharmaceutical Waste (#03-04-035)
- Pesticide Container Cleaning and Disposal (#01-04-024)
- Domestic Sewage Exclusion (#94-136)
- Wastewater Discharge Permits in Washington State.(#WQ-R-019)
- Guide for Dangerous Waste Generators in Washington State (#98-1252-HWTR)

Getting Started

To determine if a waste is dangerous waste, you need to know its physical and chemical nature. It is necessary to know all chemical components that make up the specific waste. Material Safety Data Sheets (MSDS) may tell you something about the properties and constituents of your waste. Without this type of information, you may have to test each waste to determine if it is dangerous waste.

The following pages describe a three-step process for waste designation. You will need a copy of the *Dangerous Waste Regulations* and *Designating Dangerous Waste* guidance (located in Appendix A).

Step 1 – Designate your waste

Take a waste inventory of your hospital, in all departments that generate waste. For each waste, follow the flow chart in the *Designating Dangerous Waste* Fact Sheet. This flow chart leads you through a series of questions that will help you decide if your waste is dangerous.

Each dangerous waste has a four-digit waste number assigned to it. If your waste meets the definition of a particular type of dangerous waste, write the four-digit waste number in the “waste number(s)” column of the **Waste Inventory Table** section of *Designating Dangerous Waste*. A single container of dangerous waste may have several different codes.

Using the flow chart, write down all of the waste numbers that apply to each waste on the **Generator Status** section of the worksheet. Stop when you reach a box on the flow chart that reads, “No further designation is required.”

Step 2 - Counting your Dangerous Waste

Dangerous waste generators must count their waste facility-wide each calendar month. Write the dangerous waste quantities in the **Waste Inventory** section of the **Generator Status Worksheet** to determine generator status (small, medium, or large quantity generator).

The following six sections provide details on how to count wastes in various situations:

1. Stored and/or Accumulated Dangerous Waste

Dangerous waste counted under the accumulation regulations:

Dangerous waste is counted at the point of generation prior to storage or accumulation in the generator’s 90- or 180-day accumulation area. Likewise, dangerous waste accumulated under the satellite accumulation (SA) provisions (WAC 173-303-200) is also counted toward the generator’s status on a monthly basis.

Dangerous waste not counted under the accumulation regulations:

It is not necessary to count the dangerous waste again when it is moved from satellite accumulation to the generator’s 90- or 180-day accumulation area.

2. Recycled or Excluded Dangerous Wastes

As a general “rule,” dangerous waste that is stored, treated, recycled or manifested for disposal is counted. However, there are exceptions to this “rule.” This involves wastes being recycled or managed to fulfill the requirements of a conditional exclusion. Recycled solvent wastes need to be counted in a particular way. If you are recycling or reusing your wastes, refer to Sections -016, -017 and -120 of the *Dangerous Waste Regulations* and the fact sheet *Counting Dangerous Waste under the Dangerous Waste Regulations*, publication # 98-414 (in Appendix A). For excluded wastes, refer to Sections -071 and -073 of the *Dangerous Waste Regulations*. There is a conditional exclusion for state-only dangerous waste disposal of controlled substances, legend drugs, and over-the-counter drugs for hospitals and pharmacies. See the publication *Focus on Pharmaceutical Waste* in Appendix A for an explanation of the pharmaceutical waste conditional exclusion.

3. Closed - loop Recycling without Prior Accumulation or Storage

Under this counting exclusion there can be no storage or accumulation prior to the closed-loop recycling activity. “Without prior storage or accumulation” means that as soon as the waste is generated, it immediately enters the recycling unit through a piped system. Dangerous waste residues and still bottoms generated from the recycling activity are counted. If you are “closed-loop recycling” your wastes, refer to Sections -017 and -120 of the *Dangerous Waste Regulations* and the fact sheet *Counting Dangerous Waste under the Dangerous Waste Regulations*, publication # 98-414 in Appendix A.

4. Domestic Sewage Exclusion (Water Quality)

The Domestic Sewage Exclusion (DSE) allows dangerous waste to be discharged to a publicly owned wastewater treatment works (POTW) only when such wastes are treatable at the POTW, and the discharger has a permit which authorizes the discharge of the specific waste described in the permit. For more information, please refer to section -071 of the *Dangerous Waste Regulations* and *Domestic Sewage Exclusion* (publication number 94-136) and *Wastewater Discharge Permits in Washington State* (Ecology Report WQ-R-019 Revised 10/03), in Appendix A.

Dangerous waste counted under the DSE:

Dangerous waste managed prior to being directly discharged to the sanitary sewer system is counted. This means dangerous waste stored, treated, or recycled prior to the point of direct discharge is counted.

Dangerous waste not counted under DSE:

As a policy, Ecology will not require dangerous wastes mixed with domestic sewage to be counted when the waste is being directly discharged into the POTW system in compliance with the domestic sewage exclusion (WAC 173-303-071(3)(a)).

5. Permit-by-Rule (Water Quality)

The Permit-by-Rule (PBR) provisions allow on-site treatment of dangerous waste without a written Resource Conservation and Recovery Act ("RCRA") Treatment, Storage, and Disposal ("TSD") treatment permit under certain conditions, such as waste treated in a wastewater treatment unit, elementary neutralization unit, or totally enclosed treatment unit. Please refer to sections -040 and -802(5) of the *Dangerous Waste Regulations* for additional permit-by-rule requirements.

Dangerous waste counted under PBR:

Dangerous wastes removed from the PBR unit are counted and no longer covered by the PBR provisions. Examples of wastes that are counted include, but are not limited to, sludges, still bottoms, and other residuals.

Dangerous waste not counted under PBR:

Wastes managed immediately upon generation in an on-site PBR unit are not counted. "Immediately" means that there is no temporary storage, accumulation, or other type of waste management between the point of generation and the PBR unit. The system is piped. Dangerous wastes discharged to a Publicly Owned Treatment Works (POTW) in compliance with the PBR provisions are not counted.

6. Treatment by Generator

For information on Treatment by Generator (TBG) requirements, refer to *Dangerous Waste Regulations*, sections -170(3) and -200. TBG provisions allow generators to treat their own dangerous waste on-site without obtaining a RCRA "TSD" treatment permit. For additional guidance, refer to *Treatment by Generator* (publication #96-412), in Appendix A.

Dangerous waste counted under TBG:

Dangerous waste intended for treatment under the TBG allowance is counted toward the generator's status before it is treated. A TBG activity is considered a separate activity from the production or cleaning process originally generating the dangerous waste. Therefore, dangerous waste derived from (generated at) a TBG activity is also counted toward the generator's status.

Step 3- Determine your Generator Status

Use the **Generator Status** Worksheet and follow the instructions. Add up all of the pounds of dangerous wastes generated for the month, from all departments throughout your hospital. You can now determine if you are a small, medium, or large quantity generator, and what you must do to correctly handle your waste. You may be:

- A *small quantity generator* (SQG) and responsible only for following the handling requirements described in WAC 173-303-070(8) in addition to any county or city hazardous waste management requirements; or
- A *medium quantity generator* (MQG) and required to follow the standards listed by WAC 173-303-201 and -202; or
- A *large quantity generator* (LQG) subject to full regulation under the requirements of WAC 173-303-170 and -200.

Dangerous Waste Management

In the state of Washington, hospital staff have the responsibility to manage waste properly. Municipal solid waste, biomedical, and dangerous waste needs to be managed separately following the distinct management and disposal requirements for each waste type. Dangerous waste generation amounts need to be counted throughout your hospital, each month. The *Dangerous Waste Regulations* describe the characteristics or properties that cause a waste to be considered dangerous, and what amounts of waste cause you to be regulated as a dangerous waste generator.

Designating Dangerous Waste, in Appendix A, leads you through the steps you must take to determine whether you generate a dangerous waste subject to special handling requirements. The designation process works well for most dangerous wastes. Generators should be aware, however, that exclusions exist for certain dangerous wastes. Refer to the dangerous waste exclusions (section -071) of the *Dangerous Waste Regulations*.

Satellite Accumulation

A "satellite" is defined as a location at or near the point of hazardous waste generation, where waste is initially accumulated in containers before consolidating it at a designated accumulation area (*i.e.*, centralized dangerous waste storage/accumulation area). Satellite accumulation provisions are:

1. 55 gallons of each dangerous waste or 1 quart of each acutely hazardous waste can be accumulated;
2. The satellite area must be secured and under the control of the process operator;
3. Satellite accumulation is allowed without a permit if the generator complies with these WAC 173-303 sections:

- Container labeling/marking requirements -200 (1)(d)
- Condition of containers -630 (2)
- Compatibility of waste with containers -630 (4)
- Containers be closed -630 (5)(a)
- Container handling to prevent leaks -630 (5)(b)
- Special requirements for ignitable or reactive wastes -630 (8)(a), and
- Special requirements for incompatible wastes -630 (9)(a) & (b).

When 55 gallons of dangerous waste or 1 quart of acutely hazardous waste is accumulated in a satellite accumulation area, the container(s) must be marked immediately with accumulation date. The waste must be moved within three days to the designated central storage/accumulation area. If you are a large quantity generator, the time limit for storage is 90 days. If you are a medium quantity generator the time limit is 180 days. If you are a small quantity generator there is no limit as long as you do not collect more than 2,200 pounds.

Treatment by Generator

You can treat some dangerous waste generated in your hospital without a permit. Described below are the “treatment by generator” (TBG) methods that are allowed without a permit. Before treating a waste you must know if any of the following restrictions apply:

- land disposal restriction standards,
- wastewater disposal limits and restrictions, when “permit by rule” standards apply, or
- when a RCRA “TSD” treatment permit is necessary.

Permission might be necessary when you are doing treatment that does not fit within the categories below. Contact your local Ecology Regional Office (addresses and phone numbers listed in back of this guide), and ask for a hazardous waste inspector if you have any questions about treatment methods, information on treatment permits, or are seeking authorization to conduct treatment without a permit. Ask for someone from the Water Quality Program if you have questions regarding disposing wastes down the drain or wastewater discharge permits. We strongly encourage you to find an alternative to disposing wastes down the drain.

When doing TBG, you must keep a treatment log. Record the date of treatment, hazardous waste constituents, treatment method(s), and pounds of waste treated. This is very important because the amount of waste generated before treatment must be reported to Washington State Department of Ecology in your *annual hazardous waste report*.

Remember, you may need to do multiple treatment methods to remove all hazardous waste constituents. Record all methods used on the treatment log.

Treatment by Generator Methods

In this section, six treatment methods are summarized. Obtain guidance for each of these methods by calling Ecology’s Hazardous Waste and Toxics Reduction publications office at (360) 407-6752.

1. Solidification or Stabilization

Solidification or stabilization reduces the mobility of dangerous waste and/or the toxicity of pollutants. Solidification reduces or eliminates the free liquids in the waste. Stabilization

limits the hazard potential of a dangerous waste by converting the constituents into a less soluble form. The solidified waste must pass the Paint Filter Liquids Test (PFLT). The waste must be solidified by using non-biodegradable solidification materials. The solidified waste must be resistant to change due to temperature, wet/dry cycling, radiation exposure, chemical exposure, and compressive forces.

Elementary Neutralization

Elementary neutralization reduces the corrosivity (acidic or caustic properties) of a waste. The material's pH is raised or lowered to a neutral pH range between six and nine. Neutralization should be done by trained staff. Manage and dispose elementary neutralization treatment residuals according to state and local regulations. If there are any other dangerous waste constituents in the waste, the waste must be disposed and coded according to proper disposal requirements. Obey local wastewater discharge limits and restrictions.

Carbon Adsorption

Carbon adsorption uses molecular attraction to bind soluble and gaseous chemicals to carbon. The carbon removes the chemical contaminants until it reaches its adsorptive capacity. Use carbon to remove metals, organic solvents, inorganic, and organic contaminants from wastes. See the specific TBG guidance on *Carbon Adsorption* (publication # 96-415) for examples of how well various chemicals adsorb. Manage effluent, backwash, and spent carbon according to all regulations. There should be no releases to the environment. Decontaminate all equipment as needed.

Separation

Accomplish separation by using air flotation, centrifugation, coagulation or flocculation, decanting, emulsion breaking or demulsification, ion exchange, oil skimming or phase separation, precipitation, sedimentation, or clarification. See the specific TBG guidance on *Separation* (Ecology publication # 96-418) for description and definitions of separation techniques. Assure that ignitable or reactive waste treatment complies with WAC 173-303-640(9)(a). The treatment process should not alter chemical structure except to form a precipitate. No process may emit air pollutants.

Filtration

Filtering dewater waste effluents, slurries, and sludges, and removes undissolved heavy metals present in suspended solids. Filtration uses pressure to move water through the filter media, leaving solids behind. Done correctly, filtering should not pose a threat to the environment. Appropriately manage filtered liquid and filter/filter cake. Decontaminate all equipment as needed.

Evaporation

Evaporation removes water from wastes to reduce weight and volume before disposal. Evaporators are appropriate for concentrating certain inorganic wastes (no organic evaporation). The process must not pose a threat to the environment or to public health. Do not allow air pollutants to be emitted during evaporation. Do not "overcook" evaporator waste. Appropriately dispose of sludge or filter wastes. In most instances, sludges and filters designate as dangerous waste. Keep the evaporator inside secondary containment around to catch spills.

Air Quality

Whenever a new hospital is built, an existing hospital replaces or adds a boiler, ethylene oxide sterilizer (EtO), or an emergency generator, the hospital may need a Notice of Construction permit to allow limited releases of air pollution to the environment. Permits are issued by either Ecology or the local air quality agency (<http://www.ecy.wa.gov/programs/air/local.html>). Not all cities, counties, or regions in Washington State have local air quality agencies. Ecology is the air quality agency for those areas.

When planning for construction at an existing hospital or building a new facility, be sure to contact Ecology well before construction begins to determine if an air quality permit is necessary. Permitting staff can explain what circumstances require a permit and provide technical assistance to make sure the permitting process goes smoothly and quickly.

Existing equipment (boilers, EtO's or, emergency generators), may require registration with the local or state (Ecology) air quality agency. Check with the appropriate air quality agency to make sure that your hospital has all the required permits or registration.

Spills

If you have a spill of oil or a hazardous substance to the environment, you must contact both the National Response Center (1-800-424-8802) and Ecology (1-800-OILS-911 or 1-800-258-5990). Be prepared to answer questions about the nature of the spill, the identity and quantity of material spilled, the potential or actual environmental impact, and plans for clean-up.

For more information, go to Ecology's Spill Prevention, Preparedness, and Response Web site at <http://www.ecy.wa.gov/programs/spills/spills.html> or the federal Environmental Protection Agency's (EPA) oil spills Web site at <http://www.epa.gov/ebtpages/emeroilspills.html>.

Underground Storage Tanks

Underground storage tanks used to store fuel for fleet vehicles, boilers, or emergency generators, are a potential source of release of hazardous substances to the environment. Such releases are relatively rare since most older tanks have been removed or replaced with more modern systems. To minimize the chance for future leaks or releases, underground storage tank systems should use double-walled tanks and cathodic protection to minimize corrosion. Connecting pipes should be periodically checked for leaks. Ecology requires a registration tag for each underground storage tank. The \$100.00 per tank fee should be included in the hospital's master business license issued through Washington State Department of Licensing.

For more information, go to <http://www.ecy.wa.gov/programs/tcp/ust-lust/tanks.html> or <http://www.epa.gov/swrust1/fsprevnt.htm>.

Solid Waste Management

In the state of Washington, solid waste management is delegated to local (municipal and county) agencies. Permitting and other regulatory functions usually are performed by local health departments. County public works department typically develops solid waste

reduction programs. These departments have solid waste specialists to help with reduction and recycling of non-hazardous solid waste within your facility.

This guide includes solid waste reuse and recycling information in the self audit, department pages, and in the appendices under vendor and resource lists.

Biomedical Waste Management

Ten counties (listed below) in Washington State passed local ordinances with provisions for management of medical waste within their jurisdictions. Please note that in addition to these listings, other local health departments may have adopted locally initiated biomedical waste management requirements since this list was last updated. It's always a good idea to call your local health department if you're unsure if any special local provisions apply to your facility.

- Bremerton-Kitsap County Health Department, (360) 337-5672
- Island County Health Department, (360) 679-7351
- Lewis County Health District, (360) 740-1417
- Town of Friday Harbor, San Juan County (360) 378-2390
- Seattle-King County Health Department, (206) 296-4807
- Skagit County Health District, (360) 336-9380
- Snohomish County Health Department, (425) 339-5250
- Spokane County Health Department, (509) 324-1571
- Tacoma-Pierce County Health Department, (253) 798-6528
- Whatcom County Health Department, (360) 676-6724

The Washington State Biomedical Regulations are included in Appendix E.

Emergency Planning & Community Right-to-Know Act (EPCRA)

In 1987, Washington State adopted the federal SARA Title III regulations, also known as the Emergency Planning & Community Right-to-Know Act (EPCRA), in Chapter 118.40 WAC. A State Emergency Response Commission (SERC) was established to oversee implementation of requirements under this regulation, including the formation of local emergency planning committees and the development of a statewide master plan for hazardous materials incident response. Ecology receives EPCRA reports and manages the data on behalf of the Washington SERC.

Ecology staff also provides technical and regulatory assistance to businesses, local emergency planning committees, and the public. Under this regulation, both small and large businesses are required to plan for possible emergencies and report chemical storage and release information to Ecology, on behalf of the SERC, to the Local Emergency Planning Committee (LEPC), and to the local fire department, and sometimes tribal nations. Facilities that store at least 10,000 pounds of a hazardous substance such as diesel or oxygen are required to report. Extremely hazardous substances such as chlorine or ammonia are reportable at much lower thresholds; 100 and 500 pounds respectively. Get more information on reporting requirements at www.ecy.wa.gov/epcra.

Chapter 2

Self Audit Form

Hospital Self-Audit Form

Hazardous Waste	Yes	No
Number of beds? _____		
Average number of beds occupied per day? _____		
Number of staff? _____		
Average number of staff in 24 hour period? _____		
Does your hospital have a RCRA Site ID number? _____		
Do departments generating dangerous wastes have satellite accumulation areas?	<input type="checkbox"/>	<input type="checkbox"/>
Are the collection/satellite areas properly and clearly identified and labeled?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital have a centralized collection area for dangerous waste?	<input type="checkbox"/>	<input type="checkbox"/>
Are hazardous waste containers kept closed except when adding disposed waste?	<input type="checkbox"/>	<input type="checkbox"/>
Are all waste containers properly labeled with the type of dangerous waste and accumulation start date?	<input type="checkbox"/>	<input type="checkbox"/>
Are all hazardous waste containers maintained in good condition?	<input type="checkbox"/>	<input type="checkbox"/>
Does your dangerous waste storage area have a secondary containment system?	<input type="checkbox"/>	<input type="checkbox"/>
If so, will the floor in your storage area completely contain any spills?	<input type="checkbox"/>	<input type="checkbox"/>
Does the dangerous waste storage area have a floor drain?		
Where does it go? _____	<input type="checkbox"/>	<input type="checkbox"/>
Do you have any concerns about the proper storage and/or handling of your hospital's hazardous waste? If so, explain:	<input type="checkbox"/>	<input type="checkbox"/>
Do staff who handle waste receive hazardous waste management training?	<input type="checkbox"/>	<input type="checkbox"/>
Does your department keep a log of the amounts of dangerous waste generated per month?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital account for all dangerous waste generated hospital-wide?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital use a hazardous waste firm to service, properly transport, and dispose of your dangerous waste?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital keep records of hazardous waste shipping manifests (TSD-signed copy) and other dangerous waste reports/analyses for at least five years?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital have a spill plan?	<input type="checkbox"/>	<input type="checkbox"/>
Do you have emergency response information posted near a telephone?	<input type="checkbox"/>	<input type="checkbox"/>
Do you have a contingency plan with a copy filed at your local fire department?	<input type="checkbox"/>	<input type="checkbox"/>
Has your facility worked to reduce, eliminate, and recycle toxic chemicals, equipment and materials or use pharmaceutical return programs whenever possible?	<input type="checkbox"/>	<input type="checkbox"/>

What is your hospital's hazardous waste generator status?

- ☐ Generates no hazardous waste
- ☐ Generates less than 220 lbs/month and accumulates less than 2200 lbs (Small Quantity Generator)
- ☐ Generates more than 220 lbs/month but less than 2200 lbs/month (Medium Quantity Generator)
- ☐ Generates more than 2200 lbs/month or generates 2.2 lbs or more of an acutely hazardous waste (Large Quantity Generator)

Do you generate the following hazardous substances or dangerous wastes? (Check all that apply.)

- | | |
|---|---|
| <input type="checkbox"/> Glutaraldehyde | <input type="checkbox"/> Alcohols |
| <input type="checkbox"/> Formaldehyde/Formalin | <input type="checkbox"/> Ethers |
| <input type="checkbox"/> Xylene | <input type="checkbox"/> Solvents |
| <input type="checkbox"/> Stains | <input type="checkbox"/> Heavy Metals |
| <input type="checkbox"/> Dyes | <input type="checkbox"/> Germicides/Sterilants |
| <input type="checkbox"/> Pharmaceuticals | <input type="checkbox"/> Disinfectants |
| <input type="checkbox"/> Mercury-containing devices or pumps | <input type="checkbox"/> Caustics |
| <input type="checkbox"/> Amalgam | <input type="checkbox"/> Acids |
| <input type="checkbox"/> Silver/Fixer | <input type="checkbox"/> Other |
| <input type="checkbox"/> Developer (Hydroquinone) | <input type="checkbox"/> Electrical/Computer equipment (heavy metals) |
| <input type="checkbox"/> Construction/Maintenance dangerous waste | |

Does your hospital use or purchase mercury-containing equipment or supplies? (Check all that apply.)

- | | |
|---|---|
| <input type="checkbox"/> Blood pressure units | <input type="checkbox"/> Lab chemicals |

| <input type="checkbox"/> Ballasts | <input type="checkbox"/> Other PCB wastes |
| <input type="checkbox"/> Transformers | |

Universal Waste		Yes	No
Does your hospital handle universal wastes (batteries, lamps, mercury thermostats, etc.) separately from your other hazardous waste?		<input type="checkbox"/>	<input type="checkbox"/>
If yes, does your hospital label these wastes and specify type (e.g., "Batteries," "Lamps," etc.)?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital properly store universal waste in appropriate containers that prevent releases to the environment?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital document the length of time that each universal waste has been accumulating (maximum of one year)?		<input type="checkbox"/>	<input type="checkbox"/>
Medical Waste		Yes	No
Does your facility ensure that medical wastes are labeled and managed properly, segregated from dangerous wastes and solid wastes?		<input type="checkbox"/>	<input type="checkbox"/>
Are sharps segregated from other wastes and kept in a puncture-resistant biomedical waste containers?		<input type="checkbox"/>	<input type="checkbox"/>
Are all biomedical waste containers labeled "biomedical waste?"		<input type="checkbox"/>	<input type="checkbox"/>
Do you donate or compost any of the following? (Check all that apply.)			
<input type="checkbox"/> Food scraps or plate wastes	<input type="checkbox"/> Office equipment		
<input type="checkbox"/> Medical devices/equipment	<input type="checkbox"/> Edible food		
<input type="checkbox"/> Landscape waste	<input type="checkbox"/> Linen		
<input type="checkbox"/> Mattresses	<input type="checkbox"/> Other _____		
Do you recycle any of the following materials (Check all that apply.)			
<input type="checkbox"/> Paper, white	<input type="checkbox"/> Aluminum cans	<input type="checkbox"/> Shrink wrap	
<input type="checkbox"/> Paper, colored	<input type="checkbox"/> Steel cans	<input type="checkbox"/> Fluorescent lamps	
<input type="checkbox"/> Cardboard	<input type="checkbox"/> Sharps	<input type="checkbox"/> Tyvek

How does your hospital dispose of its red bag waste? (Check all that apply.)

☐ Incinerate off-site ☐ Incinerate on-site ☐ Autoclave ☐ Other: _____

Clean Water Act / Water Conservation

Does your wastewater discharge to: ☐ sewer ☐ septic system ☐ surface water

If so, what is your discharge per day (in gallons)? _____ How many discharge points? _____

Have you sampled your wastewater discharge? ☐ Yes ☐ No Last date sampled: _____

Do you have a discharge permit or authorization to discharge a pollutant? ☐ Yes ☐ No

Permit number: _____

Do you have a diagram of your sewer discharge? ☐ Yes ☐ No

If yes, please contact the Water Quality Program at your nearest Ecology Regional Office.

Does your facility discharge dangerous waste down the drain? ☐ Yes ☐ No

If so, list dangerous waste(s): _____

How much dangerous waste do you discharge? _____

Has your hospital assessed its water usage? ☐ Yes ☐ No (Visit <http://www.h2e-online.org/tools/water.htm>)

Has your hospital implemented a water conservation program? ☐ Yes ☐ No

Does your facility have a meter to monitor total water usage? ☐ Yes ☐ No

Does your hospital use any of the following water-efficient equipment or practices? (Check all that apply.)

<input type="checkbox"/> Low-flow showerheads	<input type="checkbox"/> Landscaping/irrigating	<input type="checkbox"/> Regular inspection and repair of leaks
<input type="checkbox"/> Automatic faucet shutoff	<input type="checkbox"/> Kitchen faucet/equipment	<input type="checkbox"/> Flow control mechanisms
<input type="checkbox"/> Low-flow faucets	<input type="checkbox"/> Low water X-ray process	<input type="checkbox"/> Other
<input type="checkbox"/> Low-flow toilets	<input type="checkbox"/> Re-circulate cooling water	

What facilities are at this site?

☐ Dental: ☐ traps/amalgam separators ☐ filters ☐ equipment maintenance schedule

☐ X-ray/photography: ☐ digital ☐ silver recovery ☐ recycle film

☐ Labs: ☐ pathology ☐ histology ☐ testing

☐ Pharmacy: How are pharmaceuticals disposed?

Any compounding (what)?

☐ Laundry: ☐ water recycled ☐ phosphorus free detergents (type) _____

☐ Kitchen: ☐ grinder ☐ grease trap ☐ grease inceptor

☐ Physical plant: ☐ boilers, how many? _____ ☐ other items?

☐ Vehicle or equipment maintenance: ☐ washing where? _____

☐ solvents ☐ waste oil ☐ oil/water separator

☐ Decontamination area: Location: _____ How is water collected?

☐ Sterilization/Disinfection: ☐ discharge chemicals to sewer? If yes, what chemicals?

☐ Grounds-keeping: ☐ irrigation system ☐ audit water of irrigation system

Have you tested for the following?

☐ Fats, Oils and Greases (FOG)

☐ Biological Oxygen Demand (BOD)

☐ Silver

☐ Total Suspended Solids (TSS)

☐ Mercury

☐ 126 Priority Pollutants

☐ pH

☐ Total Toxic Organics (TTO)

Clean Air Act (CAA)

Yes No

Incineration of solid waste and/or infectious waste on-site

Does your hospital incinerate solid or medical waste on-site?

☐ ☐

If so, does your hospital have a Title 5 operating permit or state air permit?

☐ ☐

If so, has the incinerator been tested and EPA, the state, or local air authority been notified?

☐ ☐

Back up power generation

Does your facility have emergency power generation back-up?

☐ ☐

If yes, type: _____

If yes to above, do you sell power back?

☐ ☐

Refrigeration and air conditioning

Does your hospital use certified technicians to service refrigeration units?	<input type="checkbox"/>	<input type="checkbox"/>
Are maintenance, repair and leak-rate records maintained for at least five years?	<input type="checkbox"/>	<input type="checkbox"/>
Do the technicians recover and recycle the CFCs from the units?	<input type="checkbox"/>	<input type="checkbox"/>
Does your facility use ammonia for the refrigeration or air conditioning system?	<input type="checkbox"/>	<input type="checkbox"/>

Underground storage tanks (UST) / Aboveground storage tanks (AST)

Does your hospital store motor fuels, waste oils, heating oils, and/or hazardous substances in USTs or ASTs?	<input type="checkbox"/>	<input type="checkbox"/>
If yes, are your tanks registered with the state?	<input type="checkbox"/>	<input type="checkbox"/>
Is there a leak detection system in use for UST system's tank and piping?	<input type="checkbox"/>	<input type="checkbox"/>

Emergency Planning and Community Right to Know, SARA Title III "EPCRA"

Does each department keep Material Safety Data Sheets (MSDS) for all hazardous substances?	<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital have on-site a listed Extremely Hazardous Substance (EHS) in any amount over the threshold reporting quantity? For more information go to www.epa.gov/tri	<input type="checkbox"/>	<input type="checkbox"/>
If yes, has your hospital submitted a notification letter identifying the EHS and facility emergency coordinator to the Local Emergency Planning Committee (LEPC)/State Emergency Response Committee (SERC)?	<input type="checkbox"/>	<input type="checkbox"/>
Do you report hazardous substance use under Toxic Release Inventory (TRI) reporting?	<input type="checkbox"/>	<input type="checkbox"/>
Has your facility worked to reduce, eliminate, and recycle toxic chemicals, equipment and materials or use pharmaceutical return programs whenever possible?	<input type="checkbox"/>	<input type="checkbox"/>

Federal Insecticides, Fungicide and Rodenticide Act (FIFRA)

	Yes	No
Does your hospital mix or blend your own pesticides? (Pesticides include disinfectants, sterilants, germicides, algacides, virucides, swimming pool compounds, insecticides, fungicides, etc.)	<input type="checkbox"/>	<input type="checkbox"/>
If yes, is your hospital registered with EPA?	<input type="checkbox"/>	<input type="checkbox"/>
If your hospital uses your own janitorial employees to apply disinfectants and other pesticides, do you offer/provide training as to the proper use of pesticides?	<input type="checkbox"/>	<input type="checkbox"/>
Are your hospital pesticide applicators licensed or certified by the state?	<input type="checkbox"/>	<input type="checkbox"/>
Are any "restricted use" pesticides used at your hospital? (See product label.)	<input type="checkbox"/>	<input type="checkbox"/>
If yes, is a certified applicator applying or directly supervising the application of the restricted use pesticide?	<input type="checkbox"/>	<input type="checkbox"/>

Purchasing ¹		Yes	No
Does your office use a centralized purchasing system so that there is not duplicate purchasing by individual departments?		<input type="checkbox"/>	<input type="checkbox"/>
Has your hospital called upon vendors and your Group Purchasing Organization (GPO) to identify and develop alternatives to harmful and/or wasteful products and materials?		<input type="checkbox"/>	<input type="checkbox"/>
Has your hospital worked with suppliers to minimize wasteful packaging?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital receive supplies in reusable shipping containers?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital use office paper with at least 30% recycled content?		<input type="checkbox"/>	<input type="checkbox"/>
Has your hospital evaluated alternatives to polyvinyl chloride (PVC) and di(2-ethylhexyl) phthalate (DEHP) – containing products?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital purchase non-toxic/less toxic alternatives for janitorial chemicals?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital use ethylene oxide?		<input type="checkbox"/>	<input type="checkbox"/>
If yes, have you evaluated alternatives?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital have a central system in place for tracking and quantifying the amount of chemicals purchased, dispensed, and disposed of?		<input type="checkbox"/>	<input type="checkbox"/>
Does your hospital track the quantity or amount of green products and services used?		<input type="checkbox"/>	<input type="checkbox"/>
Has your hospital instituted purchasing policies in any of the following areas? (Check all that apply.)			
<input type="checkbox"/> Green products	<input type="checkbox"/> Low volatile organic compound (VOC) products		
<input type="checkbox"/> Energy Star products	<input type="checkbox"/> Polyvinyl chloride (PVC) products		
<input type="checkbox"/> Less toxic materials	<input type="checkbox"/> Di (2-ethylhexyl) phthalate (DEHP) products		
<input type="checkbox"/> Latex	<input type="checkbox"/> Recycled content in products		
<input type="checkbox"/> Mercury	<input type="checkbox"/> Other (specify) _____		

Energy Conservation ²		Yes	No
Have you created a baseline of energy performance for your hospital using EPA's benchmarking tool? (http://208.254.22.6/index.cfm?c=eligibility.bus_portfoliomanager_eligibility_hospitals)		<input type="checkbox"/>	<input type="checkbox"/>
Has your hospital done an energy management review within the last three years?		<input type="checkbox"/>	<input type="checkbox"/>
Has your facility implemented a water conservation program?		<input type="checkbox"/>	<input type="checkbox"/>
Does your facility use LEED™ or Green Building standards?		<input type="checkbox"/>	<input type="checkbox"/>

¹ Read about green purchasing at <http://www.noharm.org/greenpurchasing/issue> and <http://www.ofee.gov/gp/gp.htm>

² To view EnergyStar information for healthcare, visit http://www.energystar.gov/index.cfm?c=healthcare.bus_healthcare

Has your hospital implemented any of the following within the last three years? (Check all that apply.)

- | | |
|---|--|
| <input type="checkbox"/> Heating/ventilation upgrades | <input type="checkbox"/> Lighting occupancy sensors |
| <input type="checkbox"/> Energy efficient lighting upgrades | <input type="checkbox"/> Programmable thermostats |
| <input type="checkbox"/> Air side cooling economizer cycle | <input type="checkbox"/> Control ventilation rates to minimum requirements |

Does your hospital purchase EnergyStar equipment? (Check all that apply.)

- | | | |
|---|--|-------------------------------------|
| <input type="checkbox"/> Computers | <input type="checkbox"/> Scanners | <input type="checkbox"/> Exit signs |
| <input type="checkbox"/> Monitors | <input type="checkbox"/> Fax machines | <input type="checkbox"/> TVs |
| <input type="checkbox"/> Water coolers | <input type="checkbox"/> Printers | <input type="checkbox"/> Copiers |
| <input type="checkbox"/> Multifunction devices | <input type="checkbox"/> Roofing products | |
| <input type="checkbox"/> Commercial refrigerator/freezers | <input type="checkbox"/> Other (specify) _____ | |

General

Yes No

Does your hospital have an Integrated Pest Management (IPM) Program?

☐ ☐

What environmental topics would you like more training in? (Check all that apply.)

- | | |
|---|--|
| <input type="checkbox"/> General compliance | <input type="checkbox"/> Emergency Planning and Community Right-to-Know Act (EPCRA) management system |
| <input type="checkbox"/> Mercury management | <input type="checkbox"/> Federal EPA's Spill Prevention, Control, and Countermeasures (SPCC) regulations |
| <input type="checkbox"/> Green purchasing | <input type="checkbox"/> Water conservation |
| <input type="checkbox"/> Universal waste | <input type="checkbox"/> EPA Audit Program |
| <input type="checkbox"/> Clean Air Act | <input type="checkbox"/> Green building |
| <input type="checkbox"/> Red bag waste reduction | <input type="checkbox"/> Solid waste recycling |
| <input type="checkbox"/> Resource management | <input type="checkbox"/> RCRA Hazardous waste conservation |
| <input type="checkbox"/> Energy management/conservation | <input type="checkbox"/> Other: _____ |
| <input type="checkbox"/> Environment | |

What are your top three training needs?

1. 2. 3.

Yes No

Has your hospital taken any action not covered above to improve environmental performance? (Specify)

☐ ☐

Mercury	Yes	No
Has your facility assessed and inventoried your facility for mercury devices/sources?	<input type="checkbox"/>	<input type="checkbox"/>
Have you replaced mercury thermometers with non-mercury alternatives?	<input type="checkbox"/>	<input type="checkbox"/>
Have you discontinued dispensing mercury thermometers to patients?	<input type="checkbox"/>	<input type="checkbox"/>
Are you using mercury-free blood pressure units?	<input type="checkbox"/>	<input type="checkbox"/>
Are you using mercury-free esophageal tubes and dilators?	<input type="checkbox"/>	<input type="checkbox"/>
Do you have a mercury spill response plan and have kits on hand?	<input type="checkbox"/>	<input type="checkbox"/>
Have you identified mercury-containing chemicals used in the lab?	<input type="checkbox"/>	<input type="checkbox"/>
Have you activated a plan to replace mercury-containing lab chemicals?	<input type="checkbox"/>	<input type="checkbox"/>

Notes:

Department-specific Pages

Environmental Concerns and Pollution Prevention Opportunities

These department-specific pages are designed to be distributed and used by the various departments within your hospital. Each department has a double-sided page addressing related environmental management concerns and will provide:

- A list of best management practices (BMP) and possible less toxic options;
- A list of hazardous substances and hazardous wastes often found in the specific department, and the source of the hazardous substance or waste;
- Available safe alternatives available, if any; and
- Additional methods for managing hazardous substances and reducing waste generation.

Be sure to determine the proper disposal method for all wastes.

Many of the pages briefly discuss what can or cannot be disposed in wastewater discharges. Many dangerous wastes cannot be treated appropriately at Publicly Owned Treatment Works (POTW) nor can they be discharged into septic systems. Dangerous wastes should not be disposed down the drain unless your hospital has a Washington State Waste Discharge Permit, discharge authorization to a POTW or a National Pollution Discharge Elimination System (NPDES) permit that allows certain surface water discharges after pretreatment.

Also, be sure to check with the local air authority or the Washington State Department of Ecology's Air Quality Program for managing the hospital's air emissions and air contaminant source registration requirements. Boilers, water treatment systems, Ethylene Oxide Sterilizers (EtO), back-up generator systems and fuel tanks may require regulatory oversight. Do not evaporate volatile organic compounds, oil, or petroleum-based paint wastes. Water can be evaporated off inorganic wastes (primarily metals) as long as no air pollutants are emitted. The dried metal waste would most likely be dangerous waste.

Administration and Purchasing Department

Many administrative services such as billing services, record keeping and documentation, printing and copying, and shipping and receiving generate large amounts of municipal solid waste. Recycling items such as paper, glass, aluminum cans, cardboard, plastics, computer equipment, printer and copier cartridges, wood waste and scrap metals will drastically reduce your solid waste output. Improving waste segregation systems can increase recycling and reduce solid waste.

- Buy and use durable products and materials instead of “use-once, throw-away” items. Recycle and purchase products with recycled content.
- Avoid excessive and/or unnecessary packaging. Insist that manufacturers reduce, collect, and/or re-use packaging (containers, foam peanuts, inserts). Use reusable packaging and totes instead of corrugated shipping containers.
- Collect and recycle fluorescent bulbs (keep intact), thermostats, mattresses, furniture, and equipment. Keep furniture, carpet, and equipment out of the dump. Consider having a reprocessing durable goods center. Sell or donate excess durables to clinics, shelters, and foreign medical aid.
- If they haven’t done so already, demand that your vendors start take-/buy-back programs for computers and peripherals, printer and copier cartridges, etc. Recycle computer equipment and toner cartridges.
- Use energy efficient computer equipment, lights, and appliances (Green Star/Lights Programs).
- Keep batteries out of the trash. Use non-mercury, rechargeable batteries and implement a battery collection program.
- Place mercury spill kits in mercury use areas.
- Start a mercury elimination program. Buy mercury-free products and equipment (digital sphygmomanometers and thermometers, tilt and float switches, reed or displacement relays, thermostat probes and plungers).
- Strive to achieve the Hospitals for a Healthier Environment (H2E)’s *Making Medicine Mercury-Free Award*. Find the link to H2E’s Web site in Appendix 3.
- Choose less- or least-toxic products and materials. Eliminate carcinogenic chemicals, and use CFC/Freon management systems to avoid releasing CFC’s.
- Dangerous waste is generated hospital-wide. Know your dangerous waste generator status and do hospital-wide dangerous waste generation counts monthly.
- Inventory all chemical, hazardous waste, and spill management systems. Keep all records for at least 5 years.

**Note: This is the first of 29 department-specific waste information pages. If the Administration Office manages waste for the entire hospital, the designated personnel are responsible for the information in each of these pages.*

Alternatives to and Management of Hazardous Substances found in Hospital Administration & Purchasing Departments

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
<input type="checkbox"/>	Mercury	<ul style="list-style-type: none">■ Light bulbs, lamps, and older microwaves.■ Greeting cards, gift shop novelty items with motion lights	<ul style="list-style-type: none">● Low-mercury or energy-efficient lamps● Newer microwaves● Digital thermostats● Non-mercury-containing novelty items	Check Universal Waste list in Appendix 1 to find out which can be disposed under the Universal Waste Rules and which ones must be managed as dangerous waste.
<input type="checkbox"/>	Batteries: Mercury, lead, acid, cadmium, nickel	<ul style="list-style-type: none">■ Hearing aids and pacemakers■ PDAs and digital cameras■ Communication devices	<ul style="list-style-type: none">● Rechargeable batteries● Lithium or alkaline● Zinc air	See Appendix 2 for vendor list.
<input type="checkbox"/>	Toner cartridges	<ul style="list-style-type: none">■ Copiers■ Printers	<ul style="list-style-type: none">● Recycle● Use vendor take-back programs

Anesthesia services generate dangerous wastes such as nitrous oxide, halogenated agents: halothane (fluothane), enflurane (ethrane), isoflurane (forane), and other inhalation anesthetics. Waste anesthetic gases are generally removed from the site of application by either a scavenging unit attached to the anesthesia unit which may capture halogenated waste gases with a charcoal filter or by vacuum lines which vent to the outside. Charcoal filters will not trap nitrous oxide. Spent charcoal filters and Soda Sorb must be handled as dangerous waste.

All wastes must be evaluated to determine if they are dangerous wastes, biomedical wastes (permitted or allowed), wastewater discharges, permitted air polluting emissions, or municipal solid waste. Keep municipal solid, dangerous and biomedical wastes separate. Dangerous waste cannot legally be thrown in the trash, disposed of down the drain, or evaporated into the air. All dangerous waste, including excess gas cartridges, cylinders and cans, needs to be properly collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

- Consider replacing hazardous substances, including mercury-containing devices, with less-toxic alternatives. See Appendix 2 for a list.
- Educate staff to ensure sharps containers are used solely for sharps—**not** batteries, broken glass, broken thermometers, or anything other than syringe needles, lancets, etc. Purchase reusable, leak-proof, puncture-resistant, cadmium-free sharps containers.
- Inform staff about proper segregation and disposal of red bag and biomedical waste containers.
- Use scavenging systems for anesthesia unit gas emissions. Restrict waste gases to anesthesia units—stop any flow into other work areas inside the hospital or outside. Use low-leakage equipment. Check anesthesia unit daily for possible leaks (e.g., loose tubing, etc.). Do regular maintenance checks on anesthetic units and scavenging systems—especially on equipment that is more than 10 years old. Perform quarterly monitoring of anesthetic levels in rooms that dispense anesthetics.
- Eliminate gas cylinders/cartridges/cans not currently being used or lacking a specific purpose. Return empty containers, cartridges or cylinders to supplier. Determine if they are dangerous waste.
- Keep pharmaceuticals, spent charcoal filters, halogenated anesthetic bottles, and other dangerous or biomedical waste out of the trash.
- Dangerous waste is generated hospital-wide. Know your dangerous waste generator status and do hospital-wide dangerous waste generation counts monthly.
- Maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in Hospital Anesthesia Services Departments

Hazardous wastes and substances often found in this department	Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?			
 Liquid and gas halogenated wastes	 Anesthetic gases  Containers		Return unused portions and/or containers back to vendor or dispose of properly. Filters and Soda Sorb are dangerous waste
 Waste anesthesia gases	 Air emissions  Filters  Soda Sorb	<ul style="list-style-type: none"> • Use low-leak equipment • Use scavenging units 	Routinely check equipment and maintain against leaks; avoid liquid anesthetic spills. Fit patient mask properly; turn gas supply off before disconnecting. Check wall piping and connections routinely. Do leak tests daily and monitor anesthetic levels in operating and recovery rooms, emergency dental and adjacent/other rooms receiving gases quarterly.
 Compressed gas cylinders			Eliminate gas cylinders not in use or lacking specific purpose. Return to vendor for recycling when possible.
 Dangerous waste air emissions	 Air pollutants  Halogenated gases		Capture fugitive gases and pollutants.
 Biomedical wastes	 Body fluids  Saturated materials	<ul style="list-style-type: none"> • Separate solid from biomedical waste 	Great cost savings can be achieved by separating solid from biomedical wastes.

Autopsy services generate biomedical, dangerous, and solid wastes. Determine the proper disposal methods for all wastes generated. Bio-hazardous wastes include sharps, blood, or any material saturated with blood or bodily fluids. Store and dispose in a labeled biomedical waste red bag or in a leak proof, puncture-resistant, cadmium-free, hard bio-hazardous waste container. Sharps need to be stored separately in a rigid, secure container. When containers are full, use a permitted biomedical waste hauler.

High level disinfectants and preservatives such as formalin/formaldehyde and glutaraldehyde wastes need to be neutralized, recycled, or disposed of as dangerous waste. Ecology encourages hospitals to use a central sterile department to reduce the use of cold sterilants. Less-toxic high level disinfectants are available including those containing acetic acid, peracetic acid, hydrogen peroxide, alcohols, or ketones.

- Recycle plastics, paper, cardboard, unopened surgical devices, and other items. Don't throw away items that can be reused or recycled. Distill and reuse alcohols, solvents and xylene.
- Instead of using high-level disinfectants like glutaraldehyde, formaldehyde, Bouin's solution, or formalin, investigate and use less-toxic alternatives. See the vendor list in Appendix 2 for information on less-toxic alternatives.
- Never dispose of still bottoms or other dangerous, pathological, and/or biological wastes down the drain, sink, or into the air, garbage, sewer, or septic tank.
- Properly collect, segregate, store, label and dispose of all wastes. Inform staff on proper separation and disposal of biomedical red bags, dangerous and municipal solid wastes.
- Use reusable, leak-proof, puncture resistant, cadmium-free sharps containers for needles, syringes, lancets, etc. only – not for batteries, broken glass, broken thermometers or other non-sharps.
- Neutralize disinfectants before discharging into drain/sewer. Keep high-level disinfectants, even if neutralized, out of septic systems.
- Decant formalin/formaldehyde from pathological specimens prior to packaging for disposal or reuse.
- Use digital or other mercury-free devices and instruments whenever possible. Manage mercury-containing devices (thermometers, fluorescent bulbs, etc.) dangerous waste or universal waste.
- Don't dispose of mercury down the drain or in the trash. Always wear gloves when handling mercury and mercury-containing products. Have mercury spill cleanup kits readily available—don't allow spills to be cleaned up without proper materials, equipment, and disposal methods.
- Maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in Hospital Autopsy Services

Hazardous wastes and substances often found in this department	Use or Source	Available Alternatives	Additional Management Comments
<div></div> Non-hazardous solid waste	<div></div> Packaging	<ul style="list-style-type: none"> Request less packaging Purchase in bulk when possible Use reusable totes rather than cardboard boxes 	Recycle; minimize use of hard-to-recycle plastics and glass; follow hauler's waste separation specifications.
<div></div> Bio-medical waste	<div></div> Body fluid <div></div> Saturated materials <div></div> Blood <div></div> Sharps		Make sure waste meets standards to reduce total volume; store in bio-medical waste "red bags;" separate sharps into a puncture-resistant container labeled " <i>Bio-medical Waste</i> ;" keep bio-medical and solid waste separate to reduce costs.
<div></div> Glutaraldehyde, formaldehyde, xylene and alcohols	<div></div> Chemiclaves <div></div> Tissue preservation <div></div> Embalming	<ul style="list-style-type: none"> Use autoclaves or sonic sterilization (see vendor list in Appendix 2 for alternative sterilization methods) 	<p>Waste aldehydes are hazardous. Use glycine, glutarex or formalex to detoxify them. Never discharge into a septic tank; use proper ventilation and medical monitoring of staff.</p> <p>Note: Cidex OPA is <u>NOT</u> recommended as a substitute for Chemiclaves.</p>
<div></div> Mercury	<div></div> Thermometers <div></div> Barometers <div></div> Chemicals	<ul style="list-style-type: none"> Alcohol thermometers Digital equipment Non-mercury chemicals 	Dispose or recycle as dangerous waste or universal waste (see factsheet in Appendix 1)
<div></div> Mercury	<div></div> Fluorescent bulbs <div></div> Mercury switches <div></div> Batteries	<ul style="list-style-type: none"> Low-mercury bulbs Mercury-free switches and batteries 	Dispose or recycle as dangerous waste or universal waste (see factsheet in Appendix 1)
<div></div> Dangerous waste discharges	<div></div> Wastewater		Don't pour untreated dangerous or bio-medical waste into the sewer system. Contact your local wastewater facility for regulations for your area.

Biomedical Engineering services provide support to the maintenance and supply of equipment and devices used in patient care. Wastes generated include batteries, used equipment and devices which contain mercury, degreasers and other dangerous wastes. Determine the proper disposal methods for all wastes generated.

All dangerous waste, including excess gas cartridges, cylinders and cans, needs to be properly collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

- Improve segregation systems for recycling and disposal; never mix different types of wastes. Recycle whenever possible.
- Recycle or dispose of mercury-containing devices (batteries, barometers, etc.) intact, not broken, as universal or dangerous waste. Keep batteries, switches, thermometers, manometers, barometers, and other mercury-containing items out of the trash.
- Handle mercury-containing lamps (fluorescent, mercury vapor, metal halide, high-pressure sodium vapor, or neon) with care: don't crush them. See Appendix 2 for vendors.
- Remove the entire flame sensor unit that contains mercury from the appliance that is going to be disposed. Remove mercury switches using screwdrivers or wire cutters. Store in an airtight container that is properly labeled "*Mercury Devices for Recycling or Disposal.*"
- Have a mercury spill kit available at all times and clean up spills only with proper materials and equipment. Use gloves to handle spilled mercury and dispose of properly.
- Collect and store waste electronic equipment and devices in a safe, dry place until properly disposed – don't mix them with regular garbage.
- Store each kind of solvent and waste separately. Store flammables in a specially-marked storage cabinet or "H" room. Determine if the solvents are dangerous waste and dispose properly.
- Don't dispose dangerous chemicals and their wastes down the drain or into the garbage.
- Label all containers of dangerous waste legibly and clearly.
- Maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in Hospital Biomedical Engineering Services

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging	<ul style="list-style-type: none"> Request less packaging Segregate wastes Minimize by purchasing in bulk 	Recycle; minimize use of hard-to-recycle plastics and glass.
	Electronic/computer waste (lead, mercury-containing waste)	 Cathode ray tubes  Monitors  Televisions  Hard drives		Universal waste; store in a dry, secure storage area prior to hazardous waste service disposal or recycle with a reputable reclaimer (see vendor list in Appendix 2)
	Mercury	 Thermometers  Barometers	<ul style="list-style-type: none"> Alcohol thermometers Digital equipment 	Mercury may be recycled or handled as dangerous waste.
	Mercury	 Fluorescent bulbs  Mercury switches  Batteries	<ul style="list-style-type: none"> Low-mercury bulbs Mercury-free switches and batteries 	Universal waste (see Appendix 1)
	Solvents (alcohols, ketones and chlorinated compounds)	 Equipment maintenance	<ul style="list-style-type: none"> Aqueous-based cleaners 	Collect, recycle or dispose as dangerous waste.
	Used batteries	 NiCad, lithium and others	<ul style="list-style-type: none"> Use rechargeable batteries Use mercury-free batteries 	Create a battery collection area and recycle when full; separate by type.
	Wastewater	 Dangerous waste discharges		Keep untreated dangerous and/or bio-hazardous wastes out of the sewer system. Contact your local water treatment facility for regulations for your area.

Central Sterile Reprocessing and Distribution

Central Sterile Reprocessing and Distribution services use ethylene oxide (“EtO”) sterilizers, chemiclaves which use formaldehyde or glutaraldehyde, autoclaves (steam) and chemical disinfection systems. Sterilization and high-level disinfection operations should be centralized in your hospital, if at all possible. Nearly all sterilants and disinfectants designate as dangerous waste—minimize their use to reduce cost of products and waste disposal.

Monitor air emissions of EtO and capture pollutants. Replace chemical sterilization with less-toxic processes such as sonic sterilization, gas plasma, electron beam, microwave, or hydrogen peroxide, whenever possible. EtO, with freon as the carrier gas, is in the process of being banned. Consider less-toxic carriers such as 100% ethylene oxide or carbon dioxide.

Designate all wastes to determine if they are dangerous wastes and to determine proper waste management and disposal. If high-level disinfection is necessary, neutralize with glycine or another aldehyde neutralizer (see Appendix 2 for vendors) and dispose down the drain if your hospital’s wastewater discharges go to a wastewater treatment system. If your hospital’s wastewater discharges to a septic system, collect and dispose disinfectants as a dangerous waste.

All dangerous waste needs to be properly collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see Ecology’s *Hazardous Waste Services Directory* <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

- Use durable items such as, towels, instruments, and stainless steel products.
- Neutralize high-level disinfectants before discharging to sewer. Keep Chemiclave wastewater out of septic systems; treat as a dangerous waste. Keep Chemiclaves closed.
- Manage all wastes containing formaldehyde or glutaraldehyde as dangerous waste. Keep glutaraldehyde or formaldehyde out of septic tanks even if neutralized first. Never release any dangerous waste into sewer or septic systems. Use less-toxic alternatives whenever possible.
- Use scrubbers, combustion units, or gas collection, when using EtO. Use EtO only in well-ventilated areas; monitor and dispose filter waste as dangerous waste. Don’t dispose of EtO down the drain or emit into the air.
- Fit autoclaves with recirculated cooling water systems.
- Keep batteries out of the trash.
- Recycle or dispose of any mercury-containing device (fluorescent, vapor, metal halide, and high-pressure sodium vapor, or neon lights and lamps, thermometers, etc.) as dangerous waste. Keep out of the regular garbage. Switch to mercury-free devices and products whenever possible.
- Use secondary containment and keep spill kits on hand. Train employees on proper use. Don’t try to clean up spills without proper materials and equipment.
- Maintain disposal records on-site for 5 years.

Alternatives to and Management of Hazardous Substances found in Central Sterile Reprocessing Units

Hazardous wastes and substances often found in this department	Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?			
 Municipal solid waste	<ul style="list-style-type: none">  Packaging  Paper  Disposable items 	<ul style="list-style-type: none"> • Use durable instruments • Purchase in bulk 	Recycle, reuse. Follow hauler's waste separation specifications. Segregation and recycling saves on disposal costs.
 Biomedical waste	<ul style="list-style-type: none">  Sharps  Items soaked with blood and/or bodily fluids 		Separate solid waste from biomedical wastes; separation saves on disposal costs.
 Ethylene oxide (EtO) with 88% Freon-based carrier	<ul style="list-style-type: none">  Sterilization 	<ul style="list-style-type: none"> • See alternative sterilization equipment vendor list 	Freon is being banned. Recover and dispose of EtO and Freon as dangerous waste. Filter air and dispose of spent filters as dangerous waste.
 Glutaraldehyde, formaldehyde, xylene, and alcohols	<ul style="list-style-type: none">  Used in chemiclaves 	<ul style="list-style-type: none"> • Autoclaves/sonic sterilization • See alternatives vendor list in Appendices 	<p>Aldehydes can be neutralized by using glycine or other neutralizers. Never discharge to septic system. Use proper ventilation and staff medical monitoring. Count as treated dangerous waste.</p> <p>Note: Cidex OPA is not recommended for use in chemiclaves</p>
 Glutaraldehyde	<ul style="list-style-type: none">  Cold sterilization 	<ul style="list-style-type: none"> • Use non-hazardous substance or non-inhalation hazard sterilization equipment (see Appendix 2) 	Use gloves or personal protection equipment. Use proper ventilation. Never discharge into septic system, even if neutralized. Can be neutralized and discharged to sewer. Count as treated dangerous waste.
 Waste water containing dangerous wastes	<ul style="list-style-type: none">  Dangerous waste 	<ul style="list-style-type: none"> • Reduce generation of dangerous waste (see vendor list in Appendix 2) 	Do not dispose untreated dangerous waste or into the sewer system. Contact Ecology or local wastewater facility for exact disposal regulations for your area.
 Mercury	<ul style="list-style-type: none">  Thermometers, gauges, barometers  Fluorescent bulbs, mercury switches, batteries  Electronics, equipment 	<ul style="list-style-type: none"> • Use digital or alcohol instruments • Use low-mercury bulbs and mercury-free switches and batteries 	Mercury may be recycled or handled as dangerous waste or Universal Waste (see fact sheet in Appendix 1). Store and dispose of according to local state regulations.

Clinical research generates biomedical, dangerous, and municipal solid wastes. Chemicals and wastes not generally associated with healthcare services may be present, such as solvents, alcohols, reagents, used or discarded chemicals, acid and bases. All dangerous waste, including excess gas cartridges, cylinders and cans, needs to be properly collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see Ecology's *Hazardous Waste Services Directory* <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

- Recycle or dispose of xylene, methanol, acetone, methylene chloride and other solvent wastes as dangerous waste.
- Manage chemicals and wastes properly. Use closed, clearly labeled and dated containers. Store in a secure area, keeping incompatibles separate in secondary containment. Dispose of properly.
- Dangerous wastes, including cadmium, chromium, copper, cyanide, lead, mercury, nickel, selenium, silver or zinc cannot legally be disposed down the drain.
- Store specimens prepared in formaldehyde or metal-containing fixatives away from sinks. Don't dilute chemical wastes for the purpose of disposal. You may need a wastewater discharge permit—contact your local publicly-owned wastewater treatment facility for requirements.
- Don't use a sink or hood as a secondary containment area for hazardous materials or dangerous wastes, or evaporate solvents or other organic chemical wastes in the fume hood as a means of disposal.
- Train staff on waste designation and proper disposal methods for all wastes. Keep unlike wastes separate. Count all dangerous wastes generated on a monthly basis, hospital-wide. Add any treated and recycled dangerous wastes to the dangerous waste totals.
- Avoid using chromic acid solutions for cleaning glassware. Keep waste solutions containing chromic acid out of the drain or sink—these are dangerous wastes.
- Store staining supplies in a secure storage area. If the staining waste is a dangerous waste, manage properly. Keep copper or chromium reagents used in protein, stool or albumin testing out of the sewer.
- Extract mercury from mercury-containing equipment and manage as dangerous waste. Keep mercury-containing lamps out of the garbage—manage as Universal waste.
- Don't discharge cold sterilants, such as, glutaraldehyde or formaldehyde into sewer unless thoroughly neutralized. Never dispose to septic tanks.
- Use reusable, leak-proof, puncture-resistant, cadmium-free sharps containers for needles, syringes, lancets, etc., only – **not** for batteries, broken glass or thermometers, or other non-sharps material.
- Manage cell culture or microbiological lab waste as biomedical waste. Keep microbiological lab waste from cell cultures and stains out of the garbage and/or drain.
- Wherever possible, use central sterilizing reprocessing. Install recirculating cooling water device on autoclaves or equipment that supplies cooling water.
- Replace all plastic tubing containing DEHP with tubes that are DEHP-free.
- Maintain a current inventory of all hazardous substances and chemicals stored within the facility and a materials data safety sheet (MSDS) for each chemical within the work place. Also, maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in Clinical Research Labs

Use proper ventilation. Never discharge into septic system. Detoxify and discharge to a treatment plant.
<input type="checkbox"/>	Mercury	<input checked="" type="checkbox"/> Thermometers, barometers <input checked="" type="checkbox"/> Fluorescent bulbs, mercury switches, batteries	<ul style="list-style-type: none"> Digital equipment, alcohol thermometers Use low-mercury bulbs and mercury-free switches and batteries 	Mercury may be recycled or handled as dangerous waste or Universal Waste .
<input type="checkbox"/>	Wastewater	Dangerous waste discharge		Don't discharge dangerous waste unless you have a sewer permit.

Construction, renovation, and demolition waste in hospitals mainly consists of solid waste. Hospitals must identify which materials are dangerous waste including lead shielding, lead paint peelings, asbestos (contained in some ceiling tiles, floor tiles or heating systems/boilers), demolished equipment containing lead, mercury, silver and/or cadmium (residuals in drain traps, gauges, switches, batteries, fluorescent light bulbs, and computer monitors). Light ballasts may contain PCB's.

Determine the proper disposal methods for all wastes generated. Mercury is a toxic, bioaccumulative substance and needs to be managed as dangerous waste. All dangerous waste needs to be properly collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see *Hazardous Waste Services Directory* <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

To reduce disposal costs, identify and separate wastes that are recyclable. Some debris is municipal solid waste, but the volume may warrant separate disposal in an approved construction and debris landfill. Check with your county health district and solid waste departments on local disposal requirements.

- Use recycled materials and energy-efficient design principles. See Resource List for *Green Guide to Healthcare*.
- Prevent saw-cut slurries, dirt, leftover paints (including rinse water), solvents, or toxic chemicals from getting into storm drains, sewer, or septic tanks, or run-off into streets, alleys, or parking lots.
- Ensure wastewater meets discharge standards before discharging to any drain. Don't store chemicals and other hazardous substances or wastes, above or near any drain.
- Install separate piping for laboratory and sanitary waste when installing new plumbing.
- Use an asbestos abatement contractor when removing or disturbing asbestos. Don't use any asbestos-containing materials when constructing or renovating a facility, or burn any material containing asbestos. Dispose of asbestos waste properly.
- Have spill clean up kits, materials, and neutralizing agents readily available. Train employees in spill preparedness. Clean up spills of hazardous substances immediately and dispose as dangerous waste. Never handle spilled mercury with bare hands.
- Manage waste lead paint & debris, asbestos ceiling or floor tiles, materials/equipment containing lead, mercury, silver or cadmium, batteries, computer monitors, lighting ballasts and thermostats properly – never put into trash or sewer.
- Identify and properly manage all demolition debris. Manage municipal wastes separately. Separate dangerous wastes from wastes like metal and wood wastes, used mattresses, carpeting, solid waste from construction debris, and furniture. Sort and recycle, don't mix wastes.
- Manage mercury-containing lamps (fluorescent, mercury vapor, metal halide, high-pressure sodium vapor, and neon) correctly; don't put into the regular trash. Switch to mercury-free thermostats, fluorescent lamps, switches, floats, temperature control devices, and cleaning products.
- Improve segregation systems for all wastes to aid with proper disposal and recycling.
- Replace all plastic tubing/piping containing DEHP (PVC) with tubes that are DEHP-free.
- For information on materials containing a PCB, go to: <http://yosemite.epa.gov/R10/OWCM.NSF/pcb/pcb> and get in touch with the PCB specialist at your Ecology regional office.

Alternatives to and Management of Hazardous Substances found in Construction and Renovation Areas

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	<ul style="list-style-type: none">■ Packaging■ Disposable, single-use items	<ul style="list-style-type: none">• Use durable containers• Request less packaging	Recycle cardboard, paper, newspaper, metals (including steel and aluminum), glass plastics, and packaging materials. Follow recycler’s separation specifications.

Dispose of properly as dangerous waste or Universal Waste. See vendor lists in Appendix 2.
	Polychlorinated Biphenyl (PCB)	<ul style="list-style-type: none">■ Light ballasts	<ul style="list-style-type: none">• Replace old ballasts with PCB-free ballasts	Dispose as TSCA/dangerous waste. Avoid using any material containing PCBs.
	Asbestos	<ul style="list-style-type: none">■ Flooring felt■ Rollboard, corrugated, commercial specialty paper■ Ceiling “popcorn”■ Asbestos-containing products	<ul style="list-style-type: none">• Use asbestos-free products	Use a registered asbestos removal and disposal firm. Dispose of all wastes containing asbestos as a dangerous waste or a special waste. See Ecology’s <i>Hazardous Waste Services Directory</i> at http://www.ecy.wa.gov/apps/hwtr/hwsd
	Contaminated storm water	<ul style="list-style-type: none">■ Runoff from construction area, lawns, parking areas	<ul style="list-style-type: none">• Use barriers to filter runoff from site	Keep contaminants out of storm water runoff. Do not dispose of paint or other wastes down the storm drain.
	Lead, petroleum-based paints, metals, toxic tints	<ul style="list-style-type: none">■ Paint, stains, and lacquers	<ul style="list-style-type: none">• Use latex or waterborne products• Donate usable items	Paint chips containing lead must be managed as dangerous waste. Dispose of properly. Separate dangerous and Universal Wastes.
	Construction, demolition debris	<ul style="list-style-type: none">■ Wood■ Flooring, etc.	<ul style="list-style-type: none">• Recycle• Donate usable items	Paint chips containing lead must be managed as dangerous waste. Dispose of properly. Separate dangerous and Universal Wastes.

Critical care services can include these areas:

Burns	Neonatal
Cardiac	Pediatric
Intensive Care	Surgical
Medical	

Therefore critical care can generate large amounts of wastes that may include: devices and products that contain mercury, unused pharmaceuticals, sterilants, disinfectants, anesthesia and other gas wastes, biomedical waste, solid waste, and chemotherapy waste.

All dangerous waste, including excess gas cartridges, cylinders and cans, needs to be properly evaluated, collected, stored, and recycled, treated or disposed of through a dangerous waste service firm (see *Hazardous Waste Services Directory* <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>).

- Biomedical waste, such as material containing blood and bodily fluids, needs to be stored in clearly labeled red bags or hard, leak-proof containers. Train staff about proper biomedical waste segregation and disposal.
- Manage chemicals and wastes properly. Use closed, clearly labeled and dated containers. Store in a secure area, keeping incompatibles separate in secondary containment. Dispose of properly.
- Dangerous wastes must be properly managed, it can't be disposed into the garbage, poured down the drain, or evaporated into the air.
- Air pollutant control devices (filters, scrubbers, etc.) should be used on any equipment that could potentially release emissions into the air. Contact Ecology's Air Quality Program or your local Air Quality Authority on the requirements for air pollution control for your area.
- Separate trace and bulk chemotherapy waste. Trace chemo waste can go into biomedical waste bags; bulk chemotherapy waste is classified as dangerous waste.
- Sharps should be stored in a labeled, secured, puncture-resistant, cadmium-free, container especially designed for sharps. Use the containers for sharps only - no batteries, broken thermometers, or glass.
- Consider developing a hospital program that donates or sells used equipment and furnishings.
- Investigate less-toxic alternatives to high-level disinfectants and reverse osmosis water supply equipment to reduce formaldehyde usage. Keep formaldehyde, glutaraldehyde out of drains and the sewer unless thoroughly neutralized. Don't discharge formaldehyde or glutaraldehyde into septic tank, even if neutralized. Decant formalin and formaldehyde from pathological specimens prior to reuse or disposal. Distill and reuse alcohol and solvents. Use an alternative to ethylene oxide (EtO) and Bouin's solution when available.
- Use mercury-free devices (electronic sensors, temperature strips, digital thermometers, air-, water-, or Tungsten-filled gastrointestinal tubes or bougies). Send patients home with digital thermometers.
- Keep a container for unused pharmaceuticals. Return them to the pharmacy. Keep out of sewer/septic and garbage.
- Maintain all disposal records on-site for three years.

	Lead	Sterilizer/autoclave tape	<ul style="list-style-type: none"> Non-lead indicator tape 	Dangerous waste, dispose properly.
	Wastewater	Dangerous waste being discharged down drains		Check with local waste water treatment facility for discharge limits.

Emergency departments may perform services which include the decontamination of patients, use of formalin for specimen preservation, operation of x-ray equipment, management of photographic chemicals, wastewater, silver recovery and films, mercury-containing devices, sterilants, high level disinfectants and waste pharmaceuticals. Biomedical waste in the form of saturated or free-flowing blood and bodily fluids needs to be placed in red bags or puncture-resistant containers and labeled for removal as biomedical waste. Manage sharps the same way, but store separately.

Dangerous waste cannot be disposed in the garbage, down the drain, or evaporated to the air. All dangerous waste needs to be properly stored, and recycled, treated, or disposed through a hazardous waste firm. See Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>.

- Dangerous waste that is also biomedical waste must be disinfected, then disposed as dangerous waste. Consider replacing hazardous substances and mercury-containing devices with less-toxic alternatives.
- Manage regulated biomedical wastes—soiled or blood-soaked non-dangerous wastes, culture swabs, tissues/organs, sharps, blood products, bodily fluids or isolation waste—properly, in red bags. Keep out of the garbage or sanitary sewer. Collect sharps separately; don't place sharps in red bags.
- Store all chemicals used for preserving tissues (formaldehyde, formalin, etc.) in a separate and secure area and dispose of as dangerous waste. Keep chemicals out of sinks and sewer system.
- Segregate each type of waste— dangerous, biomedical, sharps, radioactive, recyclables, or municipal solid waste. Sort and recycle wastes including solid waste and hazardous wastes.
- Recycle film and spent fixer or dispose as a dangerous waste, never put down the drain. Comply with all local and state regulations. Don't mix spent fixer waste with x-ray processor cleaning agents if they contain chromic acid, i.e., Kodak's Liquid Developer System Cleaner. If recycled on-site, use a two or three-stage silver recovery canister system. Contact your local wastewater treatment facility to make sure all local discharge limits are met with the silver recovery system used.
- Collect high-level disinfectants (i.e., glutaraldehyde) and dispose as dangerous waste. Glutaraldehyde, ethylene oxide, and anesthetic gas waste are a health hazard; don't release into air or water. Always use proper ventilation when using these chemicals.
- Use filtered or separate ventilation system in decontamination areas for hazardous emissions.
- Contain wastewater in decontaminated areas in a sump tank. Properly store all decontamination waste water until treated and prior to sewer discharge.
- Keep chemical cleaning and disinfecting agents, or their respective waste water, and any chemical containing mercury out of the drains and sanitary sewers. Dispose cleaners and soaps as dangerous waste if they contain mercury (Alconox soap, Derma scrub).
- Dispose Miller-Abbot, Cantor tubes or bougies as dangerous waste, not in the trash or red biomedical waste bags. Close, label and date the container.
- Manage epinephrine and used epinephrine residual containers as extremely hazardous waste. Never dispose of pharmaceutical waste into the garbage or down the drain.

Alternatives to and Management of Hazardous Substances found in Emergency Care Services

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Dangerous waste (Pharmaceuticals list in Appendix 1)	<ul style="list-style-type: none"> Medical procedures (epinephrine) Mercury-containing pharmaceuticals 	<ul style="list-style-type: none"> Use same class pharmaceuticals that don't contain dangerous waste, such as mercury 	Label and store according to requirements. 	Chromium (chromic acid)	<ul style="list-style-type: none"> X-ray processor cleaning agent 	<ul style="list-style-type: none"> Use cleaners without chromium (see vendor list in Appendix 2. 	Never mix chromium-containing cleaner waste with spent fixer.

Dentistry generates a variety of dangerous (hazardous), universal, biomedical, and municipal solid waste. This page provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Segregate dangerous, biomedical, and municipal solid wastes and recyclables.
- Properly manage and dispose of dangerous waste generated by the dental department (e.g., fixer, or lead foils and aprons, sterilants, and amalgam, etc.).
- Mercury is toxic and bioaccumulative. Dental amalgam is a concern if discharged into the sewer. Contact your publicly owned treatment works for local regulations and guidelines. Collect and manage amalgam for recycling or disposal as dangerous waste. Do not disinfect with bleach.
- Other dangerous wastes of concern in emergency dentistry include fixer (silver), lead shields and packaging, high-level disinfectants and sterilizers, waste pharmaceuticals, and mercury-containing devices.
- Use precapsulated amalgam alloys, not bulk mercury. Recycle used amalgam capsules, salvage, store, and recycle non-contact scrap amalgam and recycle salvage contact amalgam pieces from restorations after removal.
- Disinfect extracted teeth that contain amalgam restorations. Check with your recycler to see if they will accept extracted teeth with amalgam restorations. Don't dispose of used amalgam capsules, non-contact or contact amalgam waste, nor extracted teeth that contain amalgam in bio-medical containers into municipal solid waste. Never flush amalgam waste down the drain, or rinse vacuum pump filters, chair-side traps, or other amalgam collection devices into drains or sinks.
- Collect and recycle amalgam from separators, chair-side traps, vacuum pump filters or other amalgam collection devices. Install ISO 11143-approved amalgam separators in your department.
- Never place uncovered hands directly into cold sterilants—use nitrile gloves and aprons. Sterilants which contain glutaraldehyde are an inhalation hazard. Use products with ortho-phthalaldehyde that are glutaraldehyde-free. See vendor list in Appendix 2.
- Keep cold sterilant containers covered. Neutralize cold sterilants with an appropriate neutralizer before discharging into drain/sewer.

<input type="checkbox"/>	Zinc-based compounds	<input type="checkbox"/> Cements		Don't discharge into sewer. May be disposed as a solid waste.

Endoscopy and Cardiac Catheterization Services

There are several sources for the generation of dangerous wastes, such as mercury-containing devices, pharmaceuticals, sterilants, sharps, biomedical, disinfectants, and chemotherapy wastes. High-level disinfectants and sterilants such as glutaraldehyde and ethylene oxide gas (EtO) represent significant health and environmental hazards when released to water or air. Mercury-containing products and devices need to be managed properly.

Some suggestions for reducing pollution and wastes:

- Stop using feeding tubes, Cantor Tubes, Miller-Abbot Tubes, incubators, dilators, refrigerators, sphygmomanometers, thermometers, and other items that have mercury in them. Recycle or manage these items as universal waste.
- Replace plastic tubing & vinyl bags containing DEHP (PVC) with DEHP-free tubes wherever possible.
- Investigate least-toxic alternatives to high-level disinfectants like glutaraldehyde, formaldehyde, etc. If you must use aldehydes, then distill, filter, and reuse them. Use alternatives to EtO whenever available.
- Decant formalin/formaldehyde from pathological specimens prior to packaging for disposal-reuse.

	Air emissions	<div> <div></div> <div>Sterilization (EtO)</div> </div>	<ul style="list-style-type: none"> See vendor list in Appendix 2 for Steris, Sterrad sterilizers 	EtOs must be registered as an air pollution source.

Large amounts of meat, vegetables, and canned goods are used in hospital food service departments. This can generate substantial quantities of solid and organic wastes. Special wastes such as grease from fryalators need special collection and disposal systems to avoid disposing down the drain or as solid waste. Wastewater from dishwashing and food preparation must be monitored to avoid excess grease, harsh chemicals, or an excessive amount of organic substances being discharged into the sewer.

The following suggestions provide information on proper waste management and less-toxic alternatives. Because all dangerous waste needs to be collected, stored, and recycled, treated or disposed appropriately, it pays to reduce the generation of these wastes. To contact a hazardous waste firm to assist you, see Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>.

- Investigate food recovery programs to reduce food waste going to landfills and reduce waste costs. Consider giving food waste to farmers as feed stock. Be sure that meat and other animal products are not used in feed stock. Check with your County Health Department for guidelines.
- Avoid preparing excessive amounts of food and garnishes. Donate excess food to charitable organizations.
- Consider on or off-site composting programs, for vegetative food wastes. Consider working with other local businesses in your area to combine composting efforts to reduce costs.
- Use durable food service items (trays, covers, utensils, cups, plates, glasses, napkins, etc.). Eliminate individual condiment packaging. Use bulk milk dispensers, not individual milk cartons. Ask suppliers to reduce packaging.
- Recycle glass, cans, cardboard, plastics, and paper, whenever possible. Keep food waste out of containers you want to recycle. Avoid throwing away items that can be reused. Recycle kitchen greases—don't throw them into garbage, septic, sewer, or down the drain.
- Store, label, maintain, and dispose of chemicals properly. Use secondary containment. Replace toxic chemicals with less-toxic alternatives. Don't store toxic/hazardous chemicals near drains or above sinks. Keep chemicals to be discarded out of the trash; don't discharge into any drain, sewer, or septic tank.
- Keep area clean and free of unnecessary items and food debris that will attract unwanted pests. Reduce the use of chemical pesticides and seek non-chemical or less-toxic products and methods for pest control. Implement an Integrated Pest Management Plan.
- Avoid the purchase and/or use of mercury-containing devices or products. Keep mercury devices out of the trash—recycle or manage as dangerous or Universal waste.
- Maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in the Food Services Department

Discharge only when wastewater meets local discharge limits.
	Electronic waste	<div> <div></div> Computers <div></div> Equipment </div>		Dangerous waste: Recycle, reuse. Dispose properly. See vendor list in Appendix 2.

Conventional grounds keeping uses a variety of fertilizers and pesticides (herbicides, fungicides, insecticides, rodenticides, and anti-bacterial agents) to promote healthy plant growth and eliminate pests, molds, and bacteria. Many pesticides are extremely hazardous or dangerous, and emit volatile organic compounds into the air during and after application. Many fertilizers cause unwanted environmental side-effects.

By reducing or eliminating the need of fertilizers and pesticides, Integrated Pest Management principles minimize the risks to human health and the environment. This is accomplished by using native drought and pest-resistant, slower-growing plants instead of planting lawns that demand great quantities of water, fertilizers and pesticides. Mulches are used to reduce weeds and pests and, by reducing evaporation, decrease the need for watering. Watering may be further reduced by conducting water audits to determine how much and where water needs to be distributed.

Because all dangerous waste needs to be collected, stored, and recycled, treated or disposed appropriately, it pays to reduce the generation of these wastes. Contact a hazardous waste firm to assist you in Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwtr/hwsd/default.htm>.

- Compost yard wastes on- or off-site. Use compost and mulching for pest reduction.
- Limit or eliminate copper-based root control products.
- Follow state regulations for on-site daycares.
- Avoid high-maintenance, pest-attracting, invasive, or non-native plant species. Use drought-tolerant, slow-growing, native plants to reduce chemical and water use. Use a timed watering system during the night; don't use sprinklers during the day.
- Don't over-treat/use excessive amounts of pesticides to the point of runoff. Avoid mixing excess fertilizer or pesticide material resulting in "leftovers."
- Use less-toxic products for pest control, post notices/flags at entrances and application sites. Implement an Integrated Pest Management Plan. Identify and eliminate the causes of a pest population, rather than just treating the symptom.
- Establish preventive measures: coarse mulch for weed control, trim vegetation away from buildings, mow grass to 2 inch height, etc.
- Label waste pesticide name and storage date on containers. Clean and dispose of pesticide containers in accordance with Appendix 1.
- Clean up spills immediately and properly, and report them if necessary. Use secondary containment.
- Dedicate equipment for compatible spraying. Don't mix incompatible chemicals or rinse water. Use container rinse water as make-up water for compatible pesticide spray solutions.
- "The Label is the Law"—read pesticide labels carefully. Never mix materials which have labels indicating they cannot be legally applied to the same site.
- Protect outside environment from your operation's pollutants; provide environmental protection and waste reduction training to employees annually.
- Keep disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in the Grounds Keeping Department

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging  Disposable items	<ul style="list-style-type: none"> Request less packaging Use reusable totes/ containers 	Recycle and reuse whenever possible. Manage pesticide containers appropriately.
	Green waste	 Grounds maintenance	<ul style="list-style-type: none"> Reduce waste by using IPM 	Compost green waste. See resource list in Appendices.
	Organophosphates, chlorinated or heavy metals, other chemicals	 Pesticides and fertilizers for pest and weed control, ground maintenance	<ul style="list-style-type: none"> Use Integrated Pest Management practices (see resource list in Appendix 3) 	Use pest-resistant and native species. Use organic gardening methods. Use non-chemical/least toxic alternatives (Appendix 3). Minimize use of dangerous waste chemicals. Follow special state regulations for on-site daycare centers.
	Pressurized canisters and containers	 Sprayers  Pesticide containers  Fertilizer containers	<ul style="list-style-type: none"> Use refillable containers (always triple rinse before using another product) 	Rinsates may designate as dangerous waste. Return pressurized canisters or containers for refill or reuse to distributor.
	Contaminated pesticide containers	 Pesticides  Fertilizers	<ul style="list-style-type: none"> Rinse/wash Return for recycling 	Dangerous waste: manage properly.
	Dangerous waste contaminated wastewater	 Drains, washing equipment and cleaning out containers	<ul style="list-style-type: none"> Use rinse water as part of pesticide application 	Avoid creating contaminate rinsewater. Reuse as make-up water for compatible sprays. Contaminate wastewater can be a dangerous waste. Contact your local POTW for disposal requirements.
	Air emissions	 Chemical pesticide spraying or evaporation	<ul style="list-style-type: none"> Minimize use of volatile organic pesticides 	Avoid creating dust and don't allow material to blow around. Cover containers to avoid evaporation.
	Pesticide or fertilizers contaminated storm drain runoff	 The application of pesticides and fertilizers  Vegetation watering	<ul style="list-style-type: none"> Use pest resistant native vegetation species that require less use of pesticides and watering 	Do not allow runoff of pesticides and fertilizers. Minimize the use of water pesticides and fertilizers by using IPM and Xeriscape techniques.

Housekeeping duties in a hospital involve a variety of techniques and equipment to maintain surfaces such as floors, using strippers, waxes, and cleaners. Housekeepers are also often in charge of collecting, transporting, and overseeing the storage of all wastes generated including solid, bio-hazardous, and dangerous wastes. The operation of equipment which employs hydraulic fluids may be involved as well. Many cleaning agents, disinfectants, and detergents may contain formaldehyde or other toxic chemicals. It is important employees learn how to work safely with the products they use and how to use safer alternatives when available.

Waste (liquid, solid, or gaseous) generated must be evaluated to determine whether it is dangerous (hazardous) waste, biomedical waste, permitted, or allowed wastewater discharge, permitted air-polluting emission, or municipal solid waste. Keep municipal solid, dangerous, and bio-hazardous wastes separate. Dangerous waste cannot legally be thrown in the garbage, disposed down the drain, or evaporated into the air. Because all dangerous waste needs to be collected, stored, and recycled, treated, or disposed appropriately, it pays to reduce the generation of these wastes. To find a company that can assist you, see Ecology's *Hazardous Waste Services Directory* at <http://www.ecy.wa.gov/apps/hwotr/hwspd/default.htm>.

- Keep items that can be recycled or that must be disposed of as a dangerous waste out of the garbage/sewer/septic. Wastes and recyclables should be stored separately.
- Segregate and store biomedical, solid, and dangerous wastes and recyclables. Segregate non-compatible materials. Dangerous waste needs safe, clearly labeled containers with secondary containment.
- Use only zinc-free floor waxes or strippers and tri-butyltin-free toilet cleaners, disinfection products, and carpet and upholstery cleaners. See vendor list in Appendix 2.
- Have spill preparedness procedures clearly posted, and spill cleanup materials and neutralizing agents easily available at strategic locations. Provide spill-preparedness training for employees. Clean up hazardous waste spills immediately and dispose properly. Have Material Safety Data Sheets (MSDS) for all chemicals available to staff. Don't throw spilled dangerous or biomedical waste in the garbage.
- Minimize packaging by buying chemicals in bulk, in concentrated form, to dilute at time of use.
- Keep concentrated disinfectants out of sanitary sewer. Thoroughly neutralize cold sterilants before discharge into drains/sewer.
- Use less-toxic disinfectants. See vendor list in Appendix 2. Don't use phenolic disinfectants unless required for certain pathogens.
- Maintain dangerous waste disposal records on-site for five years.
- Use refillable, automatic soap and lotion dispensers, bulk containers for cleaning chemicals. Use air hand-dryers instead of paper towels. Avoid using hand soaps with disinfectants (anti-microbial) unless necessary—disinfectants become less effective when overused.

Alternatives to and Management of Hazardous Substances found in Housekeeping and Facility Services Department

Hazardous wastes and substances often found in this department	Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?			
 Municipal solid waste	 Packaging  Disposable items	<ul style="list-style-type: none"> Request less packaging Use vendor take-back programs 	Recycle glass, cardboard, aluminum cans, scrap wood and metal, etc., whenever possible.
 Mercury	 Fluorescent bulbs  Batteries  Monitor devices  Mop water from cleaning floors	<ul style="list-style-type: none"> Use rechargeable batteries, non-mercury batteries Use low-mercury, green tip fluorescent bulbs 	Universal waste: keep bulbs and lamps intact; recycle. Clean up mercury spills properly and keep spill kits readily available. See Appendix 2 for vendor alternative list.
 Chemicals, waxes	 Cleaning  Disinfecting  Maintaining surfaces	<ul style="list-style-type: none"> Eliminate strippers and waxes containing zinc. See vendor list in Appendix 2 for alternatives. 	Use least-toxic products, avoid spills, prepare only needed amount. Store in secondary containment. Never discharge concentrated disinfectant into sewer.
 Pesticides	 Pest control	<ul style="list-style-type: none"> IPM (see resource list in Appendices) 	Use non-chemical pest control.
 Glutaraldehyde Cidex, Glutarex, Sonacide Phenolic disinfectants	 Cold sterilization  Preservation  Disinfection	<ul style="list-style-type: none"> Consider quaternary amine disinfectants, Cidex OPA, peracetic acid 	Avoid glutaraldehyde (inhalant hazard) use; use ventilation hood and personal protective gear. Never discharge into septic. Neutralize and discharge to sewer.
 Tributyltin (chloride, neoeconate, bis tributyltin oxide, benzoate, etc.)	 Mildew control in shampoos, lavatory and germicidal cleaners	<ul style="list-style-type: none"> See vendor list in Appendix 2 	Pesticide wastes are dangerous wastes.
 Hospital generated dangerous waste	 Determine generator status (Appendix 1)	<ul style="list-style-type: none"> See Appendix 2 for list of vendor alternatives 	Hospital-wide dangerous waste generation counts taken monthly.
 Biomedical wastes	 Body fluid, parts or tissue  Body fluid saturated	<ul style="list-style-type: none"> Separate solid waste from bio-hazardous 	Great cost savings can be achieved by separating wastes.

Biomedical waste including pathological waste, waste contaminated with trace amounts of chemotherapy products and sharps are likely candidates for incineration. Incineration of hospital municipal solid waste is also a concern for good reason: PVC plastics make up a large part of the hospital's waste stream, and are converted to toxic dioxins when burned. Improper incineration temperatures and incineration of mercury-containing wastes are other air pollution concerns.

Your hospital is responsible for how its waste is managed and disposed. Take dioxin and mercury emission concerns into account when managing waste incineration on-site. To reduce toxic air emissions, incinerate only required bio-hazardous wastes and attempt to use non-combustion methods such as autoclaves and microwaves for the rest of the biomedical waste. Always use proper waste segregation methods to decrease contaminants being emitted to the environment.

Boiler air emissions are also a concern. Follow the new source performance standards for operation requirements for industrial boilers. Store and manage boiler treatment chemicals, keeping incompatibles separated and stored in secondary containment. Boilers, fuel tanks, and back-up generators also need to be registered with the local air authority or Department of Ecology.

The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Monitor air emissions (i.e., dioxins, mercury, and cadmium) and hazardous substances (formaldehyde, glutaraldehyde, etc.) with inhalation concerns used for disinfection (i.e., autoclaves, incinerators).
- Regulate PM10 (particulate), nitrogen oxides and sulfur dioxides from new boilers. Use scrubbers/filters to keep nitrogen oxide and sulfur dioxide from boilers out of the atmosphere. Don't release air emissions and residual wastes into the environment until properly removed or treated.
- Replace incinerators with alternative types of equipment for sterilization of biomedical wastes.
- Keep metals and suspended solid waste from incinerators out of the public sewer system.
- Ensure that all hazardous waste containers are closed, clearly labeled, and stored properly with secondary containment.

Alternatives to and Management of Hazardous Substances found in Hospital Incinerators and Boilers

	Hydrochloric acid, dioxin/furan, lead, cadmium, mercury	<input checked="" type="checkbox"/> Air emissions	<ul style="list-style-type: none"> Non-combustion equipment such as autoclaves, or microwave treatment 	Incinerate only those bio-hazardous substances that are required to be incinerated. Use other disposal methods for other bio-hazardous waste.

Surgical, orthopedic, neurology, urology, cardiac, psychiatric/behavioral health, geriatric, palliative care, maternal/child care (labor & delivery/birthing, postpartum care, and nursery), pediatrics, and rehabilitative care are all part of inpatient care services. Services such as dialysis and oncology may be administered in this department as well.

Wastes of concern involved with these services include high-level disinfectants, sterilants, cleaners, dangerous waste pharmaceuticals, and mercury-containing devices (thermometers, sphygmomanometers, Cantor tubes, etc.), biohazard wastes (mainly from sharps), and municipal solid waste. Residuals from these preparations may include contaminated vials, bottles, syringes, IV bags, packaging, and personal protective equipment.

The following section provides information on proper waste management, less-toxic alternatives, and reducing the generation of certain wastes.

- Use a system to collect “soft” trace chemotherapy wastes in biomedical bags and “sharp” trace chemotherapy wastes in rigid, leak-proof containers (must be labeled “for incineration only” at time of generation).
- Replace all plastic tubing and vinyl bags containing DEHP (PVC) with tubes that are DEHP-free.
- Store radionuclide waste properly for the designated time period to allow for proper decay to non-hazardous levels, then dispose of properly—not into the trash.
- Collect all reverse osmosis system and dialysis equipment disinfection waste containing formaldehyde, and dispose of as dangerous waste.
- Keep chemiclaves, etc. covered.
- Recycle old lead shields as dangerous waste.

The Kidney Dialysis Department generates wastes such as biohazardous, hazardous and municipal solid waste. Staff in this department need to determine the proper management and disposal methods for all their wastes. The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

Large quantities of liquid biohazardous wastes such as blood and other bodily fluids, are generated during hemodialysis. These wastes need to be collected and disposed as biohazardous waste. The equipment used requires water treatment and high-level disinfectants. Formaldehyde, glutaraldehyde, and phenols are used for disinfection. Often, a dilute bleach solution, acetic acid, peracetic acid, and hydrogen peroxide-based disinfectant solutions including Sporox or Cidex OPA may be used instead. Central sterilization is highly recommended.

- Collect all waste from reverse osmosis and dialysis equipment. Neutralize or dispose as dangerous waste.
- Manage glutaraldehyde and other high-level disinfectants properly. Keep away from drains.
- Find ways to reduce formaldehyde use such as reverse osmosis equipment and reusing redistilled solutions. Keep liquid waste out of the drain or sink.

Alternatives to and Management of Hazardous Substances found in the Kidney Dialysis Department

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging  Disposable, single use items	<ul style="list-style-type: none"> • Request less packaging • Use reusable totes, recycle 	Recycle; minimize use of hard-to-recycle plastics and glass. Follow hauler's waste separation specifications. Purchase in bulk.
	Biomedical waste	 Blood, body fluids  Sharps	<ul style="list-style-type: none"> • Separate solid waste from biomedical waste 	Make sure waste meets standards to reduce total volume. Store in biomedical "red bags." Separate sharps into a puncture-resistant, clearly labeled container.
	Dangerous waste pharmaceuticals	 Patient care	<ul style="list-style-type: none"> • Send back to manufacturer • Use reverse distribution 	Dangerous waste: Label/store according to requirements.
	Mercury	 Thermometers  Sphygmomanometers  Other monitoring devices  Fluorescent bulbs  Batteries	<ul style="list-style-type: none"> • Use digital equipment • Low- or non-mercury bulbs and batteries • Non-mercury cleaning agents • Alcohol thermometers 	Dangerous waste: keep separate from other types of hazardous waste. Don't handle with your bare hands. Know the location of the nearest mercury spill kit.
	Glutaraldehyde, formalin, formaldehyde, cleaning solutions	 Cold sterilization  Disinfection	<ul style="list-style-type: none"> • Alternative sterilization equipment • Bleach, acetic acid, peracetic acid or hydrogen peroxide • Neutralize with deactivation compound 	Use other chemicals or processes to avoid using glutaraldehyde (e.g., reverse osmosis equipment, recycle/reuse solution). Enclose operation areas. Use local exhaust ventilation. Hand and store properly. Use personal protective equipment. You cannot legally dilute to meet discharge limits. Dilution is not an allowed treatment method. Only discharge to sewer if meets local limit of 1% or less.
	Wastewater containing dangerous waste	 Patient care  Disinfection	<ul style="list-style-type: none"> • See vendor lists in Appendix 2 	Don't dispose dangerous waste into the sewer. Contact your local public wastewater facility for regulations for your area.

Laboratory Services: Testing, Pathology & Histology

Laboratory testing involves many different processes which generate dangerous waste such as halogenated hydrocarbon-containing solvents, xylene, alcohols, formalin, disinfectants, mercury-containing chemicals and devices, stains and other hazardous substances.

If nuclear/radioactive wastes are retained on-site, they must be maintained properly until they decay to a non-hazardous level, and disposed as dangerous waste, if necessary. When sharps are included with the material, maintain the material until proper decay level has occurred, then dispose of as a biomedical waste.

The following section provides information on proper waste management and alternatives for using less-toxic products and reducing the generation of certain wastes.

- Avoid using chromic acid solutions for cleaning glassware. Rinsate is dangerous waste.
- Manage mercury-containing histology fixatives, B5, Zenker's solution, ion-selective electrode chloride analysis, and stains as dangerous waste.
- Don't dispose of specimens prepared in formaldehyde or metal-containing fixatives in a sink.
- Dispose of wastes from cell culture and stains as biomedical/infectious waste unless approved to discharge to your wastewater treatment facility.
- Don't dispose of: - microbiological or xylene waste generated from cleaning slides, solvents used for thin-layer or gas chromatography (i.e., chloroform, methylene chloride, etc.), waste from the titrametric analysis of chloride in sweat, copper or chromium reagents used in protein, stool, or albumin testing down the drain or into the trash. Dispose of as dangerous waste.
- Don't use Bouin's solution, seek alternative.
- Store radionuclides in a safe place for the designated time period for proper decay to non-hazardous levels, then dispose of properly as dangerous waste. Never dispose of radionuclides in the trash. Dispose of dangerous waste generated by atomic absorption spectrophotometer analysis properly.
- Store all staining supplies in a secure storage area and dispose of as dangerous waste.
- Dispose/recycle cathode tubes, bubbler traps and other mercury-containing devices as dangerous waste or universal waste, never into the regular trash.

Alternatives to and Management of Hazardous Substances found in Laboratory Services

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging	<ul style="list-style-type: none"> Request less packaging from suppliers Minimize use of hard-to-recycle plastics and glass 	Follow hauler's waste separation specifications. Purchase in bulk.
	Mixed biomedical waste	 Preserved tissue specimens	<ul style="list-style-type: none"> Reduce by separating solid and biohazardous waste 	Dispose of as required by law. Keep sharps separate.
	Chemical wastes: alcohols, xylene, toluene, n-butyl acetone, picric acid, acids and bases, phenols and other dangerous waste	 Laboratory testing and cleaning	<ul style="list-style-type: none"> Use premixed testing kits involving solvent fixation, non-halogenated compounds, simple alcohols or ketones, aqueous reagents (Alconox), replace xylene with Histosolve. 	Dangerous waste. Never dispose of chemicals to a septic system. Recycle xylene, formaldehyde, alcohol and acetone. Reuse or recover solvents through distillation. Consider sonic sterilization instead of chemical sterilization.
	Mercury	 Calibration manometer  Thermometers  Incubators	<ul style="list-style-type: none"> Use digital equipment Alcohol thermometers (see vendor information in Appendix 2) 	Recycle mercury or dispose as dangerous waste.
	Mercury	 Fluorescent bulbs  Mercury switches  Batteries	<ul style="list-style-type: none"> Use low-mercury bulbs (T-5, T-8) and mercury-free batteries and switches 	Universal waste. See fact sheet in Appendix 1.
	Mercury, mercuric nitrate, sulfate or oxide; sodium iodate, silver nitrate, copper sulfate, Zenker's, B-5 and Helley's fixative: zinc formalin	 Zenker's, B-5 solution, tissue fixatives and process chemicals (formalin, still bottoms), filter paper, B-5 recovery supernatant, rinsate, alcohol, pigment removal waste, section shavings, and tissue blocks	<ul style="list-style-type: none"> Use mercury-free fixatives and other chemicals (see vendor information on less-toxic alternatives in Appendix 2) 	Dangerous waste. Don't dispose of chemicals or testing wastes down the drain or in the trash. Many chemicals contain minute amounts of mercury, but don't list it as an ingredient. Please contact supplier and request mercury-free products.
	Chromic acid	 Cleaning glassware	<ul style="list-style-type: none"> See vendor list for alternatives in Appendix 2 	Dispose as dangerous waste.

Hospitals that provide laundry services on-site may have concerns, such as water and energy use, wastewater discharges, boiler chemical use, industrial detergents, disinfectants, chemicals, metals, and biomedical wastes.

- Purchase the most energy-efficient equipment available.
- Re-use and recycle. Use reusable surgical and patient gowns, diapers, coveralls, drapes, mattress pads instead of disposable items when available.
- Keep wastes and recyclables separate. Don't mix waste materials into linens for disposal.
- Keep hazardous material (thermometers, rags used to clean up chemical spills, etc.) out of laundry. Avoid chlorinated solvents/cleaners/degreasers, and products that contain toxic substances like mercury, zinc, chromium, and tri-butyl tin.
- Reuse gray water and use water-efficient equipment (e.g., tunnel washers, other automated systems) to reduce water use.
- Seek methods to dissolve wastes in the pre-soak stage of washing. Eliminate excessive amounts of grease and oil from wastewater.
- Pre-treat wastewater—through equalization, coagulation/flocculation, dissolved air floatation, micro/ultra filtration clarification, or oil/water separator if possible—if it contains significant amounts of metals and/or organics. Don't discharge wastewater into any drain, sewer, or septic tank unless it meets local standards.
- Don't discharge laundering/cleaning chemicals down any drain or sewer without approval from your treatment facility. Contact your local publicly-owned wastewater treatment facility for regulations.
- Conserve water wherever possible.
- Don't discharge wastewater to the ground.
- Store chemicals within secondary containment, away from floor/sink drains. Keep incompatible substances separate, plug floor drains in areas where hazardous chemicals are stored, and clearly chemical wastes properly.
- Use solvents as long as possible before disposal and never dispose into sewer or storm drains. Don't dispose of solvents before "their time."
- Replace mercury-containing switches, thermostats, and other equipment/devices, with non-mercury switches and devices. Don't purchase equipment with mercury-containing devices. Remove mercury buildup from sewer pipes, sumps, and sink traps. Mercury waste is a dangerous waste. Mercury can be recycled.
- Keep MSDSs and spill kits readily available. Have a spill plan and train your staff. Clean up spilled materials and neutralizing agents immediately, report spills as required.
- Prepare just enough cleaning chemicals to get the job done. Use automated chemical measuring systems whenever possible.
- Maintain all disposal records on-site for five years.

Alternatives to and Management of Hazardous Substances found in the Laundry and Linen Services Department

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
<input type="checkbox"/>	Municipal solid waste	<input checked="" type="checkbox"/> Packaging <input checked="" type="checkbox"/> Disposable items	<ul style="list-style-type: none"> Request less packaging 	Recycle and reduce packaging. Use reuseable totes/containers when possible.
<input type="checkbox"/>	Solvents, decalcifiers, degreasers, disinfectants, bleach, hydrogen peroxide	<input checked="" type="checkbox"/> Cleaning <input checked="" type="checkbox"/> Disinfecting <input checked="" type="checkbox"/> Decalcifying	<ul style="list-style-type: none"> Use least-toxic chemicals whenever possible 	Only use non-chlorinated solvents, recycle, consider automated bleach pump to machines to prevent spillage, use most dilute form hydrogen peroxide.
<input type="checkbox"/>	Mercury	<input checked="" type="checkbox"/> Temperature control and monitoring devices and switches <input checked="" type="checkbox"/> Bleach <input checked="" type="checkbox"/> Sodium hydroxide	<ul style="list-style-type: none"> Use digital equipment See vendor lists in Appendix 2 	Mercury is dangerous waste. Recycle. Replace all mercury-containing devices with non-mercury devices. Be sure wastewater meets local POTW standards.
<input type="checkbox"/>	Water usage and wastewater discharges	<input checked="" type="checkbox"/> Cleaning linens	<ul style="list-style-type: none"> Use energy and water conserving equipment See vendor lists in Appendix 2 	Make efforts to reduce wastewater. Conserve by recycling gray water and purchase water efficient equipment (tunnel washers and other automated systems).
<input type="checkbox"/>	Dangerous waste contaminated wastewater	<input checked="" type="checkbox"/> Disinfectants <input checked="" type="checkbox"/> Cleaners <input checked="" type="checkbox"/> Detergents	<ul style="list-style-type: none"> Use less-toxic products See vendor lists in Appendix 2 	No dangerous waste can be disposed down the drain. Check with your local POTW about discharge limits for your area.
<input type="checkbox"/>	Dry cleaning solvents (PERC)	<input checked="" type="checkbox"/> Air emissions	<ul style="list-style-type: none"> Use non-solvent dry cleaning methods 	Most dry cleaning solvents and filters are dangerous waste.
<input type="checkbox"/>	Electronics and electrical equipment	<input checked="" type="checkbox"/> Computers and other equipment	<ul style="list-style-type: none"> Recycle See vendor lists in Appendix 2 	Dangerous waste if not recycled. Use a reputable company for recycling.

Maintenance services includes water treatment systems management, collecting dangerous, biomedical, and solid waste; maintaining equipment and facilities, and janitorial services. Many of these services generate wastes. Maintenance services may generate solvents, degreasers, paints, boiler water treatment chemicals, CFC's, mercury-containing devices and lighting, PCB-containing ballasts, batteries, flammable products, and other hazardous substances and dangerous wastes.

Encourage recycling of paper, glass, aluminum cans, cardboard, plastics, computers and other equipment, furniture, printer, and copier cartridges, kitchen grease, wood waste, and scrap metals. Improving waste segregation systems can increase recycling, reduce solid and biomedical waste, and save money.

Dangerous waste cannot legally be thrown in the garbage, disposed down the drain, or evaporated into the air. Wherever possible, replace hazardous substances with less-toxic alternatives. See less-toxic vendor lists in Appendix 2.

- Re-use solvents as long as possible before disposal and never dispose into sewer or storm drains.
- Keep a current chemical inventory system.
- Keep oil, grease, sludge out of drains or sewer.
- Properly store ion exchange resin and reverse osmosis treatment system chemicals, separate acids and bases. Use secondary containment, plug drains.
- Don't use electrolysis to introduce chromium, tributyltin, copper and silver into water disinfection. Wastewater ends up metal-loaded.
- Either replace water vacuum pumps with non-water systems, or use mechanical pumps without water seals (water seals cause solvents to be carried out with the waste water).
- Don't use water aspirators, single-pass cooling water, or seal water for vacuum pumps -replace with re-circulating systems.
- Use corrosion-prevention measures for your re-circulating hot water system.
- Remove mercury buildup from sewer pipes, sumps, and sink traps.
- Save money and reduce municipal solid waste by recycling metals, paper, cardboard, plastic and glass.
- Waste oil from vacuum pups and lubricants can be re-refined. Don't mix solvents in waste oil.
- Be sure air emissions from HVAC systems, boilers and fueling meet local standards.
- Waste generated hospital-wide will determine your generator status monthly. Complete hospital-wide dangerous waste generation counts.

Alternatives to and Management of Hazardous Substances found in the Maintenance Department

<input type="checkbox"/>	Acids, caustics, pesticides	<ul style="list-style-type: none">Janitorial supplies	<ul style="list-style-type: none">See vendor lists in Appendix 2	Dangerous waste; neutralize acids/bases.
<input type="checkbox"/>	Biomedical/infectious wastes	<ul style="list-style-type: none">Body fluid saturated materialsSpecimens/tissue	<ul style="list-style-type: none">Separate solid wastes from biomedical	Great cost savings can be achieved by separating wastes.
<input type="checkbox"/>	Pesticides	<ul style="list-style-type: none">Pest control	<ul style="list-style-type: none">Use IPM methods	See vendor lists in Appendix 2.

The chemicals of concern within this area include formalin, formaldehyde, glutaraldehyde, and other high-level disinfectants and preservatives, solid (SW) and biomedical waste (BW) and mercury. Formaldehyde and glutaraldehyde may be recycled as dangerous waste or neutralized. See vendor lists in Appendix 2 for substitutes and neutralizers. If your hospital does not already have central sterilization please consider having a central sterile department. It will reduce costs and the use of sterilants and high-level disinfectants used in the hospital.

Your department needs to determine the proper disposal methods for all wastes. The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Keep chemiclaves closed—never allow them to remain open.
- Tissue samples preserved in formalin need to be separated and properly managed for disposal.
- Mercury, found in various equipment and cleaning agents within the facility such as thermometers, batteries and lighting, is extremely toxic even in small amounts and must be disposed of as hazardous waste.
- Donate items that are no longer used at the hospital but are still usable by others.

Alternatives to and Management of Hazardous Substances found in Hospital Morgue Services

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging	<ul style="list-style-type: none"> Request less packaging Recycle Purchase in bulk 	Minimize the use of hard to recycle plastics and glass. Follow hauler's waste separation specifications.
	Biomedical waste	 Body preparation wastes  Sharps	<ul style="list-style-type: none"> Separate solid waste from biomedical waste 	Store in red bags or hard containers (sharps) and dispose of when full to the appropriate waste hauler.
	Formaldehyde	 Tissue preservation  Embalming	<ul style="list-style-type: none"> Neutralize prior to discharging to sewer 	Mixed waste (formaldehyde and tissue) needs to be separated, disinfected and disposed as dangerous waste.
	Glutaraldehyde, formaldehyde, xylene and alcohols	 Used in chemiclave	<ul style="list-style-type: none"> Use autoclaves or sonic sterilization Neutralize aldehydes prior to sewer disposal 	Dangerous waste; never discharge into septic system. Use proper ventilation. Cidex OPA is not recommended as a substitute in chemiclaves. Consider sonic sterilization instead of chemical.
	Glutaraldehyde	 Cold sterilization	<ul style="list-style-type: none"> Cidex OPA, Sporox, Metrex Compliance, other similar products 	Use gloves or PPE. Use proper ventilation. Never discharge into septic systems. Can be detoxified and discharged to a treatment plant.
	Mercury	 Thermometers  Barometers	<ul style="list-style-type: none"> Digital equipment Alcohol thermometers 	Mercury may be recycled as universal waste or handled as dangerous waste.
	Mercury	 Fluorescent bulbs  Mercury switches  Batteries	<ul style="list-style-type: none"> Use low-mercury bulbs (T-5, T-8) Use mercury-free switches and batteries 	Universal waste (see fact sheet in Appendices).
	Dangerous waste	 Wastewater	<ul style="list-style-type: none"> See vendor list in Appendix 2 	Don't dispose dangerous or bio-hazardous waste into the sewer system. Contact your local wastewater facility for exact regulations for your area.

Various radionuclides are used in Nuclear Medicine for a variety of processes and need to be managed with care until they are at safe enough radioactive levels for disposal. It is important to know how they must be managed.

The most common radionuclides used at hospitals include tritium, iodine-125, and carbon-14. Be sure you are maintaining those radionuclides stored on-site properly until they decay to a non-hazardous level. This includes short-lived radioactive waste.

Low-level radioactive waste storage containers need to have labeling clearly stating the isotope and its form, the volume, laboratory origin, activity, and chemical composition. Use central processing if possible. Have long-lived radioactive waste removed to an off-site location for proper storage and decay. When the material is considered non-radioactive, properly dispose the waste. Determine if it designates according to the *Dangerous Waste Regulations*.

When biomedical waste such as sharps are included with the material, maintain the material until proper decay level has occurred, then dispose of as biomedical waste. Use less hazardous isotopes whenever possible. Because radioactive waste cannot be treated or neutralized, source reduction and substitution are the main strategies to minimize such wastes.

Your department needs to determine the proper disposal methods for all wastes. The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Use less hazardous isotopes whenever possible.
- Keep radionuclides out of the trash.
- Investigate nuclear byproduct materials' proper handling requirements from the Nuclear Regulatory Commission (NRC).
- Properly segregate label and store radioactive wastes. Isolate wastes for the designated time period to allow for proper decay and dispose properly.
- Determine if the remaining properly decayed waste is regulated as a dangerous waste. Make sure it is properly stored and disposed.
- Remember to monitor radioactivity on a regular basis while radionuclides are in storage.
- Update log books monitoring radioactive decay on a routine basis.
- Properly manage dangerous waste that is also biomedical. Disinfect, then decay radioactive materials, then dispose as a dangerous waste.
- Use silver recovery equipment or have reclaimed off-site. Never dispose of photochemical wastes, including silver-bearing, down the drain.

Alternatives to and Management of Hazardous Substances found in Nuclear Medicine

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	<ul style="list-style-type: none">  Packaging  Disposable items  Single-use items 	<ul style="list-style-type: none"> • Recycle metals, paper, cardboard, plastic and glass • Request less packaging 	Recycle and minimize use of hard-to-recycle plastics and glass. Follow hauler's waste separation specifications. Purchase in bulk.
	Radionuclides	<ul style="list-style-type: none">  Tracers  Diagnostic  Treatment procedure 	<ul style="list-style-type: none"> • Use less radioactive isotopes whenever possible 	Isolate radionuclides until considered non-radioactive; properly dispose of remaining material. Replace iridium-192 and cesium-137 with radium-226.
	Wastewater contaminated with dangerous waste	<ul style="list-style-type: none">  Chemicals  Solvents and disinfectants disposed in drains 	<ul style="list-style-type: none"> • See list of less-toxic alternatives in Appendix 2 	Do not dispose dangerous waste into the sewer system. Contact your local wastewater facility for exact regulations for your area.
	Biomedical waste	<ul style="list-style-type: none">  Sharps  Blood/bodily fluid saturated materials 	<ul style="list-style-type: none"> • Separate solid and biomedical wastes 	Store in a non-breakable, sealable, sturdy container; dispose of appropriately when full.
	Glutaraldehyde and other high-level disinfectants	<ul style="list-style-type: none">  Disinfection  Sterilization 	<ul style="list-style-type: none"> • Hydrogen peroxide, peracetic acid, acetic acid (Sporox, Cidex, Steris 20, Sterrad 50 and Sterrand 100S, Sterilox 2501, Metrex Compliance) 	Label and store according to requirements. Segregate non-compatible materials. Never store over sink. MSDS should be readily available.
	Radioactive contaminated personal protective clothing	<ul style="list-style-type: none">  Personal protective clothing  Cloths and sheeting 	<ul style="list-style-type: none"> • See vendor information in Appendix 2 	A new line of biodegradable product engineered specifically for the nuclear industry called Orex is available. After treatment (decay), Orex products may be disposed down the drain.
	Silver	<ul style="list-style-type: none">  Imaging 	<ul style="list-style-type: none"> • Use digital imaging 	Silver-bearing waste can be recycled or disposed as dangerous waste.

Oncology services include the administration of chemotherapy medications. It is important to know how to manage wastes generated when preparing and administering chemotherapy medication and disinfecting equipment. Evaluate all wastes to determine if they are dangerous waste. Many wastes from chemotherapy pharmaceuticals, mercury-containing devices, disinfectants, and sterilants are dangerous waste (DW).

The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Place residuals from chemotherapy medication preparation in either the “bulk” or “trace” categories and dispose of each type according to guidelines.
- Segregate chemotherapy medication residuals from other, non-chemotherapy dangerous wastes.
- Use preformulated/premixed chemotherapy drugs whenever possible to avoid excess.
- Keep radionuclides, chemotherapy contaminated clothing, gloves, etc. out of the regular trash.
- Use **cadmium-free** red bags for biomedical waste. Educate staff about proper segregation of biomedical waste (only trace, not bulk, chemotherapy drugs can be placed in biomedical waste containers).
- Isolate, segregate, label and store radioactive wastes properly for the amount of time needed to decay to non-hazardous levels. Dispose properly.
- Determine whether nuclear byproduct materials generated are regulated by the Nuclear Regulatory Committee (NRC) or state agencies. Follow the regulations.
- Reduce biomedical waste (blood, bodily fluids, sharps) by separating from solid waste. Store in biomedical red bags. Separate sharps into a puncture-resistant, clearly-labeled container.
- Avoid the use and disposal of pharmaceuticals from medical procedures that are dangerous waste, such as epinephrine. Label and store according to requirements. Segregate incompatible materials.
- Waste water contaminated with dangerous waste can contain solvents, disinfectants, pharmaceuticals and chemotherapy wastes. Keep untreated dangerous and/or biohazardous waste out of the sewer system. Contact your local water treatment facility for regulations in your area.
- Use sanitizing, disinfecting and sterilizing chemicals (such as formaldehyde, glutaraldehyde, or chlorine) in well-ventilated areas. Airborne emissions are regulated by WISHA/OSHA.
- Releasing dangerous wastes into the sewer is illegal except for NPDES-permitted facilities. Always check local requirements.

Alternatives to and Management of Hazardous Substances found in the Oncology Services Department

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	 Packaging  Single-use items	<ul style="list-style-type: none"> • Request less packaging • Use reusable totes 	Recycle/minimize the use of hard-to-recycle plastics and glass. Follow hauler's waste separation specifications. Purchase in bulk.
	Mercury	 Thermometers  Sphygmomanometers  Other monitoring devices	<ul style="list-style-type: none"> • Digital devices • Alcohol thermometers 	Universal or dangerous waste. Segregate from other types of dangerous waste. See vendor list in Appendix 2 for alternatives.
	Chemotherapy dangerous waste	 Trace chemo  Bulk chemo	<ul style="list-style-type: none"> • Use premixed chemo drugs to reduce waste generated 	Dispose of <i>bulk</i> chemo wastes as dangerous waste. <i>Trace</i> chemo wastes can be disposed as biomedical waste.
	Radioisotopes	 Nuclear medicine	<ul style="list-style-type: none"> • Use less hazardous isotopes 	Once considered non-radioactive, determine if the waste is dangerous waste.
	Glutaraldehyde, formaldehyde, xylene	 Cleaning and sanitizing  Disinfecting  Sterilizing	<ul style="list-style-type: none"> • Sonic sterilization, acetic acid, hydrogen peroxide, peracetic acid, (Sporox, Cidex, Steris, Sterrad, Sterilox) 	Never release into the septic system. Neutralize aldehydes or dispose as dangerous waste. Keep MSDSs on hand and available.
	Lead	 Radiation shields	<ul style="list-style-type: none"> • Use less-toxic alternatives. See vendor list in Appendix 2 	Make sure old lead shields are reused, recycled or disposed as dangerous waste.

Services in this area include surgery, diagnostics, oncology, women's health/gynecology, general medicine, family practice, orthopedics, pulmonary, allergy, urology, pediatrics and rehabilitative services. There are several sources for the generation of dangerous wastes, such as mercury-containing devices, pharmaceuticals, sterilants, disinfectants and chemotherapy wastes.

The following section provides information on proper waste management and possible alternatives for using less-toxic products and reducing the generation of certain wastes.

- Sharps need to be segregated from other biomedical wastes and stored in cadmium-free, sealed, properly-labeled, puncture-resistant containers.
- Pharmaceutical products should be collected and returned to the pharmacy.
- Use a system to collect "soft" trace chemotherapy wastes in biomedical red bags and "sharp" trace chemotherapy wastes in rigid, leak-proof biomedical containers.
- Keep bulk chemotherapy waste out of biomedical bags. Bulk chemotherapy waste will designate as a dangerous waste. Implement a management program to separate bulk chemo wastes from trace chemo wastes. That way, most of the waste generated in chemotherapy administration areas can be categorized as "trace" chemotherapy wastes, which can be packaged and disposed of with biomedical waste. Residuals include contaminated vials, bottles, syringes, IV bags and tubing, packaging, personal protective equipment and linens.
- Use and provide non-metallic medications and shampoos, not selenium-containing shampoo unless necessary.
- Do not dilute waste water containing dangerous waste to meet discharge limits. Contact your local POTW and follow their requirements.

Alternatives to and Management of Hazardous Substances found in Outpatient Care Services

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	<ul style="list-style-type: none"> ■ Packaging ■ Single-use items 	<ul style="list-style-type: none"> • Request less packaging • Use reusable totes 	Recycle. Follow hauler's waste separation specifications.
	Mercury	<ul style="list-style-type: none"> ■ Fluorescent bulbs ■ Mercury switches ■ Batteries 	<ul style="list-style-type: none"> • Low-mercury bulbs • Mercury-free switches and batteries 	Manage as universal wastes, see fact sheet in Appendix 1.
	Mercury	<ul style="list-style-type: none"> ■ Thermometers ■ Monitoring devices ■ Miller-Abbot tubing 	<ul style="list-style-type: none"> • Use digital equipment • Tungsten-filled G.I. tubing and bougies 	Mercury can be recycled or managed as dangerous waste. Phase out mercury-containing devices or equipment. Hurst and Malone have mercury/PVC-free tubing.
	Chemotherapy and antineoplastics	<ul style="list-style-type: none"> ■ Patient treatment 	<ul style="list-style-type: none"> • Reduce volumes used • Centralize chemo compounding 	Use pre-made compounds.
	Glutaraldehyde, formaldehyde	<ul style="list-style-type: none"> ■ Cleaning and sanitizing ■ Disinfecting ■ Sterilizing ■ Chemiclaves¹ 	<ul style="list-style-type: none"> • Recycle, reuse, autoclave • Microwave, electron beam • Gas plasma, hydrogen peroxide 	Never release into the septic system. Neutralize aldehydes or dispose as dangerous waste. Check with POTW. Use gloves, personal protection equipment and proper ventilation.

	Dangerous waste pharmaceuticals	<ul style="list-style-type: none"> ■ Patient medications (cresols, lindane, mercury preservative) 	<ul style="list-style-type: none"> • Send back to manufacturer • Use reverse distributor 	Dangerous waste; do not discharge to sewer. See Ecology pharmaceutical fact sheet in Appendix 1.
	Ethylene oxide (EtO)	<ul style="list-style-type: none"> ■ Sterilization (heated) 	<ul style="list-style-type: none"> • Consider using steam or sonic sterilization 	Steris, Sterad, Sterilox

¹ Cidex OPA is not recommended as a substitute in Chemiclaves.

Pharmacies may accumulate unused or expired medications and chemicals which need to be disposed of properly. Some pharmaceuticals and other generated wastes may designate as dangerous/ hazardous waste.

Many common waste pharmaceuticals are toxic, ignitable, reactive, caustic, or state-only dangerous wastes that include toxic and persistent criteria wastes. Some common sources of pharmaceutical wastes include: IV preparation, compounding, spills/ breakage, partially used vials and syringes, unused/ outdated preparations/ pharmaceuticals, unused repacks, chemo wastes, and patient medications.

Pharmacy services throughout a healthcare facility generate large quantities of packaging, insert paper, and waste plastics. Residual wastes, including dangerous waste, from administration of pharmaceuticals to patients are also numerous.

- Separate bulk from trace chemotherapy waste; use a system to collect trace chemotherapy wastes in biomedical bags and “sharp” trace chemo wastes in rigid, labeled, leak-proof containers. Manage bulk chemotherapy wastes as dangerous waste.
- Use single-dose, not multiple-dose vials of chemotherapy drugs. Don’t purchase and prepare chemotherapy drugs in excess when pre-formulated, pre-mixed preparations are available.
- Keep chemotherapy-contaminated clothing and gloves out the regular trash.
- Establish an identification protocol for dangerous waste pharmaceuticals; manage them properly and purchase least-toxic alternatives.
- Work with radiation safety officer to establish protocols for radioactive waste decay and find ways to minimize generation of radioactive wastes.
- Maintain an ongoing inventory of pharmaceutical and chemical stores. Use first in – first out system for pharmaceuticals. Don’t allow unused, outdated, or spoiled chemicals or medications to sit on shelves. Inventory often and use take back programs.
- Autoclave indicator tape is leaded and must be handled as dangerous waste.
- Reuse or recycle electronic waste (such as computers) as dangerous waste.

Alternatives to and Management of Hazardous Substances found in Hospital Pharmacy Departments

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Dangerous waste generated hospital-wide	 Compounding  Corrosives, reactives, acids/bases and solvents	<ul style="list-style-type: none"> See vendor list of less-toxic substitutes in Appendix 2 	Take monthly counts of hospital-wide dangerous waste generation.
	Dangerous waste pharmaceuticals	 Unused/outdated medications, controlled substances	<ul style="list-style-type: none"> Return to manufacturer before end date or use reverse distribution 	Inventory often. Use first in – first out system. Pharmaceutical disposal to garbage or sewer is not acceptable.
	Chemotherapy and antineoplastics	 Patient treatment and wastes	<ul style="list-style-type: none"> N/A 	Reduce excess and centralize chemo compounding locations. Use pre-formulated compounds. Bulk chemo wastes are dangerous wastes.
	Mercury (thimerosal) and mercury-containing items and monitoring devices	 Pharmaceuticals  Mercurochrome, ophthalmic products, nasal sprays, vaccines, preservatives  Batteries, lamps, switches	<ul style="list-style-type: none"> Use non-mercury-containing medications, devices and equipment 	Hazardous waste. Collect, recycle, reuse, or dispose of as dangerous or universal waste.
	Silver nitrate	 Burn medicines	<ul style="list-style-type: none"> Use alternative anti-bacterial creams 	Dispose silver concentrations of 5 ppm or more as dangerous waste.
	Radionuclides	 Radioactive wastes	<ul style="list-style-type: none"> Decay waste 	Manage and dispose properly.
	Selenium	 Dandruff shampoos	<ul style="list-style-type: none"> Apple cider vinegar rinse 	Minimize use of medicated shampoo.
	Waste water with dangerous waste	 Drains, sinks	<ul style="list-style-type: none"> Recycle or dispose as dangerous waste 	Meet local limits for metals and other wastes.

If prosthetic devices are made on-site, leather-working chemicals and plastics-molding chemicals may be used. Mercury containing devices may also be used. Biomedical waste such as sharps, blades, forceps, and lancets may be generated if debridement or treatment of burns or wounds takes place. It is important for you to know how they must be managed and disposed of properly. Be sure that you are meeting all labeling, storage, and disposal requirements.

- Tanning chemicals and adhesives from plastic-molding and leather-making wastes may need to be separated and disposed of as dangerous waste.
- Disinfection can use highly toxic chemicals such as formaldehyde and glutaraldehyde. Less toxic forms are available including acetic acid, peracetic acid, hydrogen peroxide, and simple alcohols and ketones. Central sterilization may be the best option.
- All sharps or materials contaminated with blood or bodily fluids need to be disposed of as biomedical waste.

Alternatives to and Management of Hazardous Substances found in Hospital Physical Therapy Services Departments

Use or Manage?			
 Municipal solid waste	 Packaging	<ul style="list-style-type: none"> • Purchase in bulk • Request less packaging 	Recycle paper, cardboard, metals (aluminum cans), glass, newspaper and plastics. Follow hauler's waste separation specifications.
 Dangerous waste related to leatherwork, plastic casting, etc.	 Rehabilitation  Production of prosthesis devices	<ul style="list-style-type: none"> • See vendor list of less-toxic substitutes in Appendix 2 	Dangerous waste. Separate chemicals appropriately while in storage.
 Dangerous wastes	 Waste water	<ul style="list-style-type: none"> • See vendor list of less-toxic substitutes in Appendix 2 	Do not pour dangerous or biomedical wastes into the sewer system. Contact your local waste water facility for the regulations for your area.
 Glutaraldehyde	 Cold sterilization	<ul style="list-style-type: none"> • Cidex, OPA, Sporox, Metrex Compliance or other similar product 	Use gloves or personal protective equipment. Use proper ventilation. Never discharge into septic system. Can be detoxified and discharged to a treatment plant.
 Mercury	 Thermometers  Barometers	<ul style="list-style-type: none"> • Digital equipment and alcohol thermometers 	Mercury can be recycled or handled as dangerous waste.
 Mercury	 Fluorescent bulbs  Mercury switches  Batteries	<ul style="list-style-type: none"> • Use low-mercury bulbs • Mercury-free switches • Rechargeable batteries 	Dangerous or universal wastes – see fact sheet in Appendix 1.
 Biomedical waste	 Sharps  Forceps  Blades and lancets	<ul style="list-style-type: none"> • Use source separation to reduce waste 	Place in cadmium-free puncture-resistant clearly labeled container.

Radiology and X-ray services may generate dangerous waste with the use of lead shields, film processing (silver), and other activities. Film and fixer from the developing processes will contain silver.

Low-level radioactive wastes are generated as a byproduct of radiopharmaceuticals, radioimmunology, and nuclear medicine administration procedures. Contaminated materials may include solid wastes, biomedical

wastes, and dangerous wastes. These low-level radioactive wastes include clothing, cleaning materials, medical tubes, swabs, injection needles, syringes, laboratory animal carcasses, and tissues that came into contact with radioactivity.

- Silver from the fixer waste can be reclaimed off-site or on-site by being passed through a filter or silver recovery system. Recycle silver and film.
- Biomedical waste, including sharps and blood-saturated materials need to be disposed in puncture-resistant, leak proof (preferably cadmium-free) red bags and disposed of properly.
- Use “dry” developing methods, switch to digital imaging.. Facilities that switched to PAX systems and digital x-rays have reduced their pollution output of fixer/developer and silver.
- Check with your local waste water treatment facility for requirements for developer and other chemical discharges into the sewer.
- Use low silver content film, implement an on- or off-site silver recovery program.
- Recycle or handle fixer and other spent photographic waste as dangerous waste, don’t discharge into sewer into the sewer or on-site septic system.
- Identify lead-containing supplies and equipment and designate for reuse, recycling, or dangerous waste disposal. Consider adapting lead shielding material for other uses within Radiology. Consider lead-free aprons without vinyl coverings.
- Keep spent developer, chromic acid, selenium-bearing solutions, and spent fixer separate, never mix. Manage chromic acid solutions and waste water properly and seek less-toxic substitutes.
- Use less-toxic developers and fixers. Extend fixing bath life, add ammonium thiosulfate, use an acid stop bath prior to fixing bath, add acetic acid to keep pH low, and use squeegees. Use closed-loop recirculation systems.
- Store chemicals, film, and paper properly for longer shelf-life, and don’t throw photographic film and paper into regular garbage—recycle it.
- Keep fixer/developer tanks covered (fewer evaporation and oxidation problems). Never use off-spec developer.
- Designate radioactive wastes before disposal. Most need to be disposed of as dangerous waste. Properly decay radioactive materials prior to disposal. Work with radiation safety officer to establish protocols for radioactive waste decay. Minimize radioactive waste generation.

Alternatives to and Management of Hazardous Substances found in Hospital Radiology Services Departments

Hazardous wastes and substances often found in this department		Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?				
	Municipal solid waste	<ul style="list-style-type: none"> ■ Packaging ■ Disposable, single-use items 	<ul style="list-style-type: none"> • Request less packaging • Buy in bulk • Use durable items 	Recycle paper, cardboard, metals and glass.
	Silver	<ul style="list-style-type: none"> ■ Spent x-ray fixer ■ Processor solution 	<ul style="list-style-type: none"> • Use digital systems • Collect/recycle on- or off-site 	Use cation exchange, electrolytic recovery, steel wool filtration for silver recovery. Recycle x-ray film.
	Mercury	<ul style="list-style-type: none"> ■ Fluorescent bulbs ■ Mercury switches ■ Batteries 	<ul style="list-style-type: none"> • Use low-mercury bulbs • Use non-mercury switches and batteries 	Handle as dangerous or universal waste. See fact sheet in Appendix 1.
	Mercury	<ul style="list-style-type: none"> ■ Thermometers ■ Sphygmomanometers ■ Monitoring devices 	<ul style="list-style-type: none"> • Use digital equipment and devices • Use Anderson tubes 	Mercury can be recycled or disposed as dangerous waste.
	Chromium chromic acid	<ul style="list-style-type: none"> ■ X-ray developer ■ Glassware ■ Tank cleaners ■ Waste water 	<ul style="list-style-type: none"> • Use non-chromium tank cleaners • Use precharged slides or silane. 	Dangerous waste.
	Collodion ether	<ul style="list-style-type: none"> ■ Developing processes 	<ul style="list-style-type: none"> • Use less-toxic preservative 	Dangerous waste.
	Selenium	<ul style="list-style-type: none"> ■ Toners 	<ul style="list-style-type: none"> • Use sodium selenate, not cysteine broth 	Replace with selenium-free version. Dangerous waste – don't discharge into sewer or septic tank.
	Lead	<ul style="list-style-type: none"> ■ Shielding (aprons, blocks) 	<ul style="list-style-type: none"> • Use non-lead alternatives (see vendor list in Appendix 2) 	Recycle or dispose as dangerous waste.
	Radioactive waste, radionuclides	<ul style="list-style-type: none"> ■ Tracers ■ Other diagnostic treatment procedures 	<ul style="list-style-type: none"> • Use less-toxic radioactive compounds with short half lives 	Keep wastes in isolation until decay permits disposal. Most decayed wastes are dangerous waste. Check with Health Department to discharge to sewer.

High level disinfectants and sterilants are used in this department. Mercury-containing products and devices may also be used. Used batteries may be generated. Proper management of pressurized tanks such as oxygen is also a concern. Make sure all oxygen and other tanks are secured. Send back empty and partially full tanks and canisters to the distributor.

- Use reusable endotracheal tubes rather than disposable ones.
- Don't use outdated equipment if leaks are a possibility.

Alternatives to and Management of Hazardous Substances found in Hospital Respiratory Care Services Departments

Hazardous wastes and substances often found in this department	Use or Source	Available Alternatives	Additional Management Comments
Use or Manage?			
 Municipal solid waste	 Packaging  Disposable items	<ul style="list-style-type: none"> • Use reuseable totes • Ask for less packaging 	Recycle cardboard, paper, metals, glass, batteries, solvents, and lamps.
 Biomedical waste	 Sharps  Blood and/or bodily fluid-soaked materials	<ul style="list-style-type: none"> • Reduce and separate solid waste from biomedical waste 	Store in biomedical “red bags.” Separate sharps into a puncture-resistant, clearly-labeled container. Send to a biomedical waste-accepting facility.
 Dangerous waste pharmaceuticals	 Patient medication (cresols, Lindane, Hg preservatives)	<ul style="list-style-type: none"> • Use reverse distributors 	See Ecology Pharmaceutical fact sheet in Appendix 1.
 Mercury	 Thermometers  Sphygmomanometers  Other monitoring equipment	<ul style="list-style-type: none"> • See vendor list in the Appendix 2 for alternative products 	Mercury can be recycled or disposed as dangerous waste. Use mercury-free devices and equipment. Use take-back programs.
 Mercury	 Fluorescent bulbs  Mercury switches  Batteries	<ul style="list-style-type: none"> • Use low-mercury bulbs • Mercury-free switches • Rechargeable batteries 	Universal wastes – see fact sheet in Appendix 1. Also see vendor lists in Appendix 2.
 Ethylene Oxide (EtO)	 Sterilization	<ul style="list-style-type: none"> • Sterrad, Steris, carbon dioxide, electron beam, gas plasma, microwave 	Routine checks on EtO cylinders and equipment for leaks. Ensure venting to outside. Return cartridges/cylinders to supplier.
 Formaldehyde, glutaraldehyde, xylene, alcohols	 Cleaning solutions and high-level disinfectants, chemiclaves	<ul style="list-style-type: none"> • Use autoclaves, microwave technologies, Cidex OPA² • Steam or sonic sterilization 	Hazardous waste. Recycle. Never discharge into septic system. Use proper ventilation. Neutralize aldehydes using Glycine, Glutarex or Formalex.

² Cidex OPA is NOT recommended as a substitute in chemiclaves.

Surgery services generate dangerous/hazardous waste, biomedical waste, and solid waste. Many substances used in surgery become dangerous wastes at the end of use. These include disinfectants, sterilants, tissue fixatives, solvents and other hazardous substances. Waste gases produced during surgical anesthesia must be managed carefully, too. Be sure that you are meeting all labeling, storage, and disposal requirements.

- Cleaning solutions and high level disinfectants and sterilants such as phenol, formalin, xylene toluene may be replaced with less-toxic chemicals such as Sonic sterilization, Sporox, Cidex, Steris, Sterad, Sterilox, and Metrex Compliance.
- Properly manage and store all hazardous chemicals used by surgical pathology units. Keep pathological waste out of the sewer.
- Employ a scavenging system to anesthetic unit to collect waste anesthetic gases, such as nitrous oxide, halothane, enflurane, isoflurane, etc. Minimize leakage and replace equipment more than 10 years old. Properly manage spent filter cartridges for anesthetic gas wastes as dangerous waste or recycle. Properly manage compressed gas cylinders and return to distributor.
- Never dispose merbromin/water solution waste down the drain, dispose as dangerous waste.
- Separate preserved tissues from formaldehyde, neutralize and dispose as dangerous waste.
- Manage and dispose epinephrine and any residuals as extremely hazardous waste, never into the trash or down the drain.

Vendor List Index

Autoclave Indicator Tape (No lead)	1
Amalgam Separators	1
Anesthetic Gas Scavenger	3
Ballasts (No PCBs or mercury)	4
Barometers (No mercury)	5
Batteries: Button Style for Hearing Aids (No mercury)	6
Batteries: Single Use/Rechargeable for Digital Equipment (No mercury)	8
Blood Bank Saline (Mercury-free preservative).....	9
Boilers and Accessories (No mercury)	9
Chemiclave Sterilants (Alternatives to ethylene oxide [EtO] and Glutaraldehyde)	11
Cleaning Agents: Mold and Mildew (No tributyltin).....	14
Cleaning Agents: (No styrene, sodium hydroxide, hydrochloric acid or phosphoric acid)	17
Collodion (No ether).....	20
Concentrating Reagents (No ethyl acetate or xylene).....	20
Cooling Recirculating Water Systems	21
Coulter Counters (No mercury).....	22
Dandruff Shampoo (No Selenium).....	23
Dental Filling Material (Mercury-free alternatives to amalgam)	23
Developer Solutions (No hydroquinone)	24
Disinfectant/ Antiseptic: Intermediate Surface Agents (No phenols, quarternary ammonium, iodophor and chlorhexidine gluconate	25
Displacement Relay (No mercury)	26
Dry Cleaning Equipment: Non-Solvent.....	27
Fixatives: Alternatives for B5 solution and PVA (No mercury).....	28
Fixatives: Alternatives to Zenker's (No mercury)	31

Fixative/Preservative for Tissues: Alternatives to Formalin and Bouin's Solution (Formaldehyde-free)	32
Float Switches (No mercury)	35
Gloves: Examination Gloves (Latex-free)	42
Gloves: Surgical Gloves (Latex-free)	43
Histological Clearing Agents (No xylene).....	49
Histology Staining Kits (No mercury, less waste).....	52
Histology Stains (No mercury)	53
HVAC Heating, Ventilation and Air Conditioning Systems and Components (No mercury).....	54
Intraocular Pressure Reducers (No mercury)	55
Infectious Waste Bags (No cadmium).....	56
Laboratory Analyses (No mercury).....	57
Laboratory Glass and Pipette Cleaner (No chromic-sulfuric acid).....	58
Lighting (Low mercury).....	59
Manometers (No mercury)	59
Mercury (II) Oxide Alternatives (No mercury)	60
Mops and Cloths: Wet Loop Mop Alternatives.....	61
Neonatal Products: Feeding Tubes, Catheters and Positioning Aids (No PVC or DEHP)	63
Neutralizing Products: Aldehyde Neutralizing Solution	69
Paints: Water-based (No mercury preservative)	71
Pest Control.....	72
Pharmaceutical Management Vendors	73
Photographic Equipment: Digital.....	73
Photographic Tank Cleaners (No chromate).....	75
Plastic Equipment for Plastic Tubing, Blood Bags, Electrodes and Other Plastic Equipment (No PVC or DEHP).....	76
Preservative for Chemicals and Pharmaceuticals (No thimerisol/mercury)..	85
Pressure Gauges and Regulators: Gas line (No mercury).....	86
Pretreatment for Laboratory and Surgical Equipment.....	87
Radiation Shielding and Material (No lead)	87
Radiography: Digital Equipment.....	90
Recovery Systems/Products: Mercury and Other Heavy Metals.....	91

Recovery Systems/Products: Solvents (e.g., formalin, xylene, etc.).....	93
Recycling/Waste Disposal Centers	94
Relay Switches (No mercury).....	98
Scoliometers (No mercury).....	99
Selective Enrichment Broth for Salmonella spp.:	
Alternatives to Sodium Selenite.....	100
Sphygmomanometers (No mercury).....	101
Sterilizing Equipment (Chemiclave alternatives).....	106
Thermometers: Basal (No mercury)	107
Thermometers: Compact Digital (No mercury)	109
Thermometers: Hypothermia (No mercury).....	111
Thermometers: Infrared (No mercury)	112
Thermometers: Kitchen (No mercury).....	114
Thermometers: Laboratory (No mercury).....	116
Thermometers: Medical Non-Electronic (No mercury).....	117
Thermometers: Medical Specialty (No mercury)	119
Thermometers: Professional Digital (No mercury).....	119
Thermometers: Weather (No mercury).....	121
Thermostat Probes (No mercury)	122
Thermostats (No mercury).....	122
Tissue Adhesive Slides (No chromium)	123
Topical Antimicrobial Ointments: Burn Wound Care (No silver nitrate or gentamycin).....	125
Totes: Reusable, Industrial Grade.....	126
Vacuum Systems and Pumps (No mercury).....	127
Washers and Dryers (Energy/Water conservation)	127
Waste Disinfection Systems.....	129
Wastewater Treatment Systems: Alternatives to Boilers and Dialysis	
Chemical Disinfection (No mercury)	130
Weighted Surgical/Internal Tubing (No mercury).....	133

Vendor Information

Washington State Department of Ecology (Ecology) is providing this information as a free and open service to the public. Ecology does not endorse any company or product identified on this or any subsequent pages listed and makes no claims regarding the accuracy, validity or effectiveness of this or any other product or service represented by the provided information.

Keep in mind the following tips when choosing a vendor:

- Ask for least toxic products available. Ask if they have products that do not become dangerous waste when spent or are recyclable.
- Ask vendors for customer references (name, phone and address) that use the product or service in the same manner you will be using it. Contact these customers and ask for their opinion of the product or service. Ask the customers what they like or don't like about the product or service.
- Contact Ecology for vendor's compliance history.
- Get a number of bids and compare. Choose your vendors carefully; consider reliability as well as costs.
- Test the product or service to see if it satisfies your requirements prior to making a commitment to purchase the product or use the service.
- Ask if the product or service is "drop in" prior to product purchase or service use or if new equipment will be necessary. Ask to see total costs or fees associated with the product or service.
- Whenever possible, require your waste contractor to pick-up only on request. In your contract with your waste hauler have it clearly written that they will only pick up on request. Keep wastes separate, if necessary. Don't over-accumulate wastes. Fill all containers prior to disposal. Keep containers closed, labeled and in good condition and stored in secondary containment, when necessary.
- Know the fate of your waste. You are ultimately responsible for the proper disposal of your waste.

The vendor list provides numerous alternatives for specific purposes. Please review the pages to find alternatives for activities occurring in your hospital. The vendor information provided is not all inclusive but attempts to give the best information gathered, to date. We plan on continuing to add useful vendor information to the list. You may find additional vendor information on the Internet.

Less Hazardous Products and Waste Management Vendors

Product and Manufacturer	Comments
<u>Autoclave Indicator Tape (No Lead)</u>	
<p>Autoclave Indicator Tape</p> <p>Research Products International Corp. 800-323-9814 http://www.rpicorp.com/index/index.html</p>	<ul style="list-style-type: none"> • Autoclave tape is less hazardous than those containing metals such as lead or materials such as PVC. • Tape will display autoclave indication after 15 minutes at 120°C. • May be used on paper, cloth, glass, metal and plastic.
<p>Steam Autoclave Indicator Tape</p> <p>Nadco, Inc. PO Box 130 Dover, NH 03820 800-839-9018 Fax: 603-692-0794 E-mail: sale@nadcoinc.com http://www.nadco-inc.com</p>	<ul style="list-style-type: none"> • Autoclave tape is less hazardous than those containing metals such as lead or materials such as PVC. • Tape will darken at 273°F (134° C) at steam pressure of 1.02kg/cm² following a 5 minute period.
<u>Amalgam Separators (Amalgam/Mercury Removal From Dental Wastewater)</u>	
<p>AD-1000</p> <p>American Dental Accessories, Inc. 7310 Oxford Street Minneapolis, MN 55426 800-331-7993 Fax: 888-729-1016 E-mail: info@amerdental.com http://www.amerdental.com/catalog/pdf%20files/pg48.pdf</p>	<ul style="list-style-type: none"> • Separates amalgam using wet or dry vacuum systems. • Maximum flow rate is 4 L/min (ISO 11143 testing). • It has been tested to remove 99.3% of the suspended amalgam in wastewater. • Made for use by up to 12 dentists at a time.

The Department of Ecology does not assume any liability for the accuracy or completeness of the information presented in the Vendor List of Less Hazardous Products. A listing of a firm does not constitute a recommendation. Proper handling and disposal of waste is the responsibility of the generator.

Description	Contains Mercury?	EPA Waste Code(s)	WA Code(s)	Designated Waste Code(s)
Pseudourea, (2-Aminoethyl) -2-Thio-, Dihydrobromide	N		WT02	D, A58, B409
Purinethol (Company: Burroughs Well and Glaxo Pharm.)	U			
Pyridostigmine Bromide	N		WT01	E, A58, B409
R P R Card Antigen Suspension (Syphilis Card Test)	N		WT02	D, A58, B219
Rabavert (Company: Chiron Thera)— Contains Mercury	U			
Rabies Immune Globulin/Thimer (Brand Name/Company: Bayrab/ Bayer Biologic_ Hyperab/Bayer Biologic_ Ingoman Rabies/ Pasteur Merieux)	Y	D009		
Rabies Vacc Adsorbed (Company: Bioport Corporation)	Y	D009		
Rabies Vacc, Human Diploid (Brand Name: Imovax Rabies I.D.; Company: Allscrips)	U			
Rabies Vacc, PF Chick-Embryo Cell (Brand Name: RABAVert; Company: Chiron Thera)	U			
Ranitidine HCL Tablets	N		WT02	D, A58, B409
Rattlesnake Venom (Phosphodiesterase I Type IV)	N		WT01	E, A58, B409
Recombivax HB (Company: Allscrips, Merck & Co. and Physicians TC)	U			
Recombivax HB Adult (Company: Merck & Co.)	Y	D009		
Rectagene (Company: Pfeiffer Co.)	Y	P092, D009		
Rector X (Company: Rose Labs)	U			
Red Cell Fixing Solution	N	D001		D, A58, B219
Reserpine	N	U200		
Resorcinol	N	U201		
RHO (D) Immune Globulin (Brand Name/Company: Gamulin RH/ Ceneon_ Hyprho-D/Bayer Biologic_ Microhogam/Ortho Diag._ Mini-Gamulin RH/Centeon_Rho (D) Immune Globulin/Ortho-Clinical Diagnostics_ Rhogam/Ortho Diag.)	Y	D009		
Rhogam (Company: Ortho diag.)	Y	D009		
RNA-DNA Extractions	N	D022	WT02, WP01	E, A94, B219
Rocall II Sanitizing Agent/Germicide (Mixture Alkyl Ammonium Chloride)	N		WT02	D, A58, B114

Biomedical Regulations

Summary of Biomedical Waste Requirements in Washington State.....	1
Chapter 70.95 RCW – Biomedical Waste.....	4
Jurisdictional Environmental Health Offices in Washington State.....	7

SUMMARY OF BIOMEDICAL WASTE MANAGEMENT REQUIREMENTS IN WASHINGTON STATE

Prepared by the Washington State Department of Health
Last Update: October 2000

CHAPTER 70.95K RCW [BIOMEDICAL WASTE]

Summary: Chapter 70.95K RCW establishes a uniform statewide definition for biomedical waste. However, the statute does not prescribe a statewide program for biomedical waste management. (Please be aware that biomedical waste management programs are often instituted by local health departments under their solid waste rule writing authorities). This chapter also prescribes requirements for disposal of residential sharps.

- Contact: Wayne Turnberg, Washington State Department of Health - (206) 522-0132, [wayne.turnberg@doh.wa.gov]

CHAPTER 175, LAWS OF 1994 - ESHB 2401 [RESIDENTIAL SHARPS DISPOSAL]

Summary: Chapter 175 of the Washington Laws of 1994 (Engrossed Substitute House Bill 2401), restricts the disposal of residentially generated sharps into recycling containers at any time, or into the trash in those parts of the State that provide sharps collection services. The Department of Ecology must maintain a list of pharmacies that will accept home generated sharps for disposal. (ESHB 2401 sections 1,2,3,4, and 6 have been codified in the Revised Code of Washington at RCW 70.95K.010; 70.95K.030; 70.95K.040. ESHE3 2401 section 5 has been codified at RCW 70.95.715.)

- List of Pharmacies Contact: Randy Martin, Washington Department of Ecology - (360) 407-6136

LOCAL INFECTIOUS WASTE MANAGEMENT PROGRAMS

Several local environmental health jurisdictions have incorporated biomedical waste management requirements/policies of varying levels of comprehensiveness and stringency. Local health jurisdictions with biomedical waste management regulations or policies include, but may not be limited to:

Bremerton-Kitsap County Health Department
Contact: Scott Daniels, (360) 692-3611

Skagit County Health District
Contact: Britt Pfaff, (360) 336-9380

Island County Health Department
Contact: Darlene Meyer, (360) 679-7350

Snohomish County Health Department
Contact: Solid Waste Specialist, (425) 339-5250

Lewis County Health District
Contact: Chris Cooper, (360) 740- 14 17

Spokane County Health Department
Contact: Steven Holderby, (509) 324-1560

San Juan County Health Department
Contact: Kay Kohler, (360) 378-4474

Tacoma-Pierce County Health Department
Contact: Solid Waste Specialist, (253) 798-6047

Seattle-King County Health Department
Contact: Eileen Hennessey, (206) 296-4831

Whatcom County Health Department
Contact: Regina Delahunt (360) 676-6724

Local Programs: Please note that in addition to this listing, other local health departments may have adopted locally initiated biomedical waste management requirements. To be certain, check with the environmental health office of the applicable local health jurisdiction to ensure the latest update on requirements. Phone numbers of the state's local health jurisdictions are included at the end of this summary document.

BLOODBORNE PATHOGEN SAFETY STANDARDS IN THE WORKPLACE

Washington State Department of Labor and Industries (L&I)

Reference: Occupational Exposure to Bloodborne Pathogens. Chapter 296-62 Part J WAC, WAC 296-62-08001 through WAC 296-62-08050.

Policy Issues Contact: Mary Miller, (L&I), (360) 902-5666

Compliance/Consultation Information: Contact your regional Department of Labor and Industries Service Center. Check the blue pages of your phonebook for local listings.

Summary: The standards, which incorporate those published by Federal OSHA at 29 CFR Part 1910.1030, prescribe occupational handling, packaging and labeling requirements for regulated waste.

BIOMEDICAL WASTE TRANSPORTATION

Washington Utilities and Transportation Commission (WUTC)

Biohazardous or Biomedical Waste Transportation:

Reference: Rules relating to the safe transportation of biohazardous or biomedical waste. (WAC 480-70-050, -500, -510, -530, -540, -550, -560, and -570).

Summary: The standard prescribes operational, training, packaging and containment, shipping paper, insurance, and accident reporting requirements for commercial transporters of biomedical waste under WUTC regulatory authority.

Contact: Cathy Anderson, (360) 664-1254 (WUTC).

Hazardous Materials (Regulated Medical Waste) Transportation:

Reference: WAC 480-14-390, incorporates federal transportation rules published at Title 49, Code of Federal Regulations, Parts 170-189 into State rule by reference

Summary: Enforced by the WUTC, the Washington State Patrol, and the US Department of Transportation (USDOT), the USDOT rules relate to the safe transportation of hazardous materials, including regulated medical waste, over the highways. The rules establish packaging, hazard communication, and tracking requirements.

Contact: Cathy Anderson, (360) 664-1254 (WUTC).

INCINERATOR OPERATOR CERTIFICATION

Washington Department of Ecology

Reference: Chapter 70.95D RCW [Solid Waste Incinerator and Landfill Operators]; Chapter 173-300 WAC [Certification of Operators of Solid Waste Incinerator and Landfill Facilities]

Summary: Chapter 70.95D RCW requires that all owners or operators of a solid waste incineration facility employ an operator that has been certified by the Department of Ecology. Chapter 173-300 WAC implements the statute.

Contact: Randy Martin, Washington State Department of Ecology, (360) 407-6136.

INCINERATOR BURN REQUIREMENTS

Reference: RCW 70.95.710, Incineration of Medical Waste

Summary: RCW 70.95.710 requires that medical waste incineration be conducted so that no portion of the combustible material is visible in its uncombusted state.

Contact: Randy Martin, Washington State Department of Ecology, (360) 407-6136.

MEDICAL WASTE INCINERATOR STANDARDS

Reference: 40 CFR Part 60 [Standards of Performance for New Stationary Sources and Emission Guidelines for Existing Sources: Hospital/Medical/Infectious Waste Incinerators]

Summary: This USEPA standard promulgates new source performance standards and emission guidelines to reduce air emissions from hospital/medical/infectious waste incinerator(s) (HMIWI) by adding subpart Ec, standards of performance for new HMIWI, and subpart Ce, emission guidelines for existing HMIWI, to 40 CFR part 60.

Contact: Bernard Brady, Washington State Department of Ecology, (360) 407-6803

STATE OF OREGON REQUIREMENTS

Statute Reference: Oregon Laws of 1989, Chapter 763 - Codified at Oregon Revised Statutes, Chapter 459.

Rule Reference: Oregon Administrative Rules, Chapter 333, Division 18; Chapter 340, Division 61; and Chapter 860, Division 66.

Summary: The Oregon biomedical waste requirements must be observed by Washington State communities exporting waste to Oregon landfills, such as the City of Seattle. Oregon requirements apply to biomedical waste generated from medical facilities and from homes (e.g. insulin syringes).

UNITED STATES POSTAL SERVICE

Reference: 30 CFR Part 111 [Mailability of Sharps and Other Medical Devices]

Summary: The federal rule prescribes packaging and mailing requirements for used sharps and other used medical devices when mailed via the U.S. Postal Service.

Contact: Wayne Turnberg, (206) 522-0132

Chapter 70.95K of the Revised Code of Washington

Biomedical Waste

RCW 70.95K.005 Findings. The legislature finds and declares that:

- (1) It is a matter of state-wide concern that biomedical waste be handled in a manner that protects the health, safety, and welfare of the public, the environment, and the workers who handle the waste.
- (2) Infectious disease transmission has not been identified from improperly disposed biomedical waste, but the potential for such transmission may be present.
- (3) A uniform, state-wide definition of biomedical waste will simplify compliance with local regulations while preserving local control of biomedical waste management. [1992 c 14 § 1.]

RCW 70.95K.010 Definitions. Unless the context clearly requires otherwise, the definitions in this section apply throughout this chapter.

- (1) "Biomedical waste" means, and is limited to, the following types of waste:
 - (a) "Animal waste" is waste animal carcasses, body parts, and bedding of animals that are known to be infected with, or that have been inoculated with, human pathogenic microorganisms infectious to humans.
 - (b) "Biosafety level 4 disease waste" is waste contaminated with blood, excretions, exudates, or secretions from humans or animals who are isolated to protect others from highly communicable infectious diseases that are identified as pathogenic organisms assigned to biosafety level 4 by the centers for disease control, national institute of health, biosafety in microbiological and biomedical laboratories, current edition.
 - (c) "Cultures and stocks" are wastes infectious to humans and includes specimen cultures, cultures and stocks of etiologic agents, wastes from production of biologicals and serums, discarded live and attenuated vaccines, and laboratory waste that has come into contact with cultures and stocks of etiologic agents or blood specimens. Such waste includes but is not limited to culture dishes, blood specimen tubes, and devices used to transfer, inoculate, and mix cultures.
 - (d) "Human blood and blood products" is discarded waste human blood and blood components, and materials containing free-flowing blood and blood products.
 - (e) "Pathological waste" is waste human source biopsy materials, tissues, and anatomical parts that emanate from surgery, obstetrical procedures, and autopsy. "Pathological waste" does not include teeth, human corpses, remains, and anatomical parts that are intended for interment or cremation.
 - (f) "Sharps waste" is all hypodermic needles, syringes with needles attached, IV tubing with needles attached, scalpel blades, and lancets that have been removed from the original sterile package.
- (2) "Local government" means city, town, or county.
- (3) "Local health department" means the city, county, city-county, or district public health department.
- (4) "Person" means an individual, firm, corporation, association, partnership, consortium, joint venture, commercial entity, state government agency, or local government.
- (5) "Treatment" means incineration, sterilization, or other method, technique, or process that changes the character or composition of a biomedical waste so as to minimize the risk of transmitting an infectious disease.
- (6) "Residential sharps waste" has the same meaning as "sharps waste" in subsection (1) of this section except that the sharps waste is generated and prepared for disposal at a residence, apartment, dwelling, or other noncommercial habitat.
- (7) "Sharps waste container" means a leak-proof, rigid, puncture-resistant red container that is taped closed or tightly lidded to prevent the loss of the residential sharps waste.
- (8) "Mail programs" means those programs that provide sharps users with a multiple barrier protection kit for the placement of a sharps container and subsequent mailing of the wastes to an approved disposal facility.

- (9) "Pharmacy return programs" means those programs where sharps containers are returned by the user to designated return sites located at a pharmacy to be transported by a biomedical or solid waste collection company approved by the utilities and transportation commission.
- (10) "Drop-off programs" means those program sites designated by the solid waste planning jurisdiction where sharps users may dispose of their sharps containers.
- (11) "Source separation" has the same meaning as in RCW 70.95.030.
- (12) "Unprotected sharps" means residential sharps waste that are not disposed of in a sharps waste container. [1994 c 165 § 2; 1992 c 14 § 2.]

NOTES: Findings--Purpose--Intent--1994 c 165: "The legislature finds that the improper disposal and labeling of sharps waste from residences poses a potential health risk and perceived threat to the waste generators, public, and workers in the waste and recycling industry. The legislature further finds that a uniform method for handling sharps waste generated at residences will reduce confusion and injuries, and enhance public and waste worker confidence.

It is the purpose and intent of this act that residential generated sharps waste be contained in easily identified containers and separated from the regular solid waste stream to ensure worker safety and promote proper disposal of these wastes in a manner that is environmentally safe and economically sound." [1994 c 165 § 1.]

RCW 70.95K.011 State definition preempts local definitions.

The definition of biomedical waste set forth in RCW 70.95K.010 shall be the sole state definition for biomedical waste within the state, and shall preempt biomedical waste definitions established by a local health department or local government. [1992 c 14 § 3.]

RCW 70.95K.020 Waste treatment technologies.

- (1) At the request of an applicant, the department of health, in consultation with the department of ecology and local health departments, may evaluate the environmental and public health impacts of biomedical waste treatment technologies. The department shall make available the results of any evaluation to local health departments.
- (2) All direct costs associated with the evaluation shall be paid by the applicant to the department of health or to a state or local entity designated by the department of health.
- (3) For the purposes of this section, "applicant" means any person representing a biomedical waste treatment technology that seeks an evaluation under subsection (1) of this section.
- (4) The department of health may adopt rules to implement this section. [1992 c 14 § 4.]

RCW 70.95K.030 Residential sharps--Disposal--Violation.

- (1) A person shall not intentionally place unprotected sharps or a sharps waste container into: (a) Recycling containers provided by a city, county, or solid waste collection company, or any other recycling collection site unless that site is specifically designated by a local health department as a drop-off site for sharps waste containers; or (b) cans, carts, drop boxes, or other containers in which refuse, trash, or solid waste has been placed for collection if a source separated collection service is provided for residential sharps waste.
- (2) Local health departments shall enforce this section, primarily through an educational approach regarding proper disposal of residential sharps. On the first and second violation, the health department shall provide a warning to the person that includes information on proper disposal of residential sharps. A subsequent violation shall be a class 3 infraction under chapter 7.80 RCW.
- (3) It is not a violation of this section to place a sharps waste container into a household refuse receptacle if the utilities and transportation commission determines that such placement is necessary to reduce the potential for theft of the sharps waste container. [1994 c 165 § 3.]

NOTES: Effective date--1994 c 165 § 3: "Section 3 of this act shall take effect July 1, 1995." [1994 c 165 § 6.] Findings--Purpose--Intent--1994 c 165: See note following RCW 70.95K.010.

RCW 70.95K.040 Residential sharps waste collection.

- (1) A public or private provider of solid waste collection service may provide a program to collect source separated residential sharps waste containers in conjunction with regular collection services.
- (2) A company collecting source separated residential sharps waste containers shall notify the public, in writing, on the availability of this service. Notice shall occur at least forty-five days prior to the provision of this service and shall include the following information: (a) How to properly dispose of residential sharps waste; (b) how to obtain sharps waste containers; (c) the cost of the program; (d) options to home collection of sharps waste; and (e) the legal requirements of residential sharps waste disposal.
- (3) A company under the jurisdiction of the utilities and transportation commission may provide the service authorized under subsection (1) of this section only under tariff. The commission may require companies collecting sharps waste containers to implement practices that will protect the containers from theft. [1994 c 165 § 4.]

NOTES: Findings--Purpose--Intent--1994 c 165: See note following RCW 70.95K.010.

RCW 70.95K.900 Section headings. Section headings as used in this chapter do not constitute any part of the law. [1992 c 14 § 5.]

RCW 70.95K.910 Severability-1992 c 14. If any provision of this act or its application to any person or circumstance is held invalid, the remainder of the act or the application of the provision to other persons or circumstances is not affected. [1992 c 14 § 6.]

RCW 70.95K.920 Effective date--1992 c 14.

- (1) Sections 2 and 3 of this act are necessary for the immediate preservation of the public peace, health, or safety, or support of the state government and its existing public institutions, and shall take effect immediately [March 20, 1992].
- (2) Section 4 of this act shall take effect October 1, 1992. [1992 c 14 § 7.]

RCW 70.95.710 Incineration of medical waste. Incineration of medical waste shall be conducted under sufficient burning conditions to reduce all combustible material to a form such that no portion of the combustible material is visible in its uncombusted state. [1989 c 431 § 77.]

RCW 70.95.715 Sharps waste--Drop-off sites--Pharmacy return program.

- (1) A solid waste planning jurisdiction may designate sharps waste container drop-off sites.
- (2) A pharmacy return program shall not be considered a solid waste handling facility and shall not be required to obtain a solid waste permit. A pharmacy return program is required to register, at no cost, with the department. To facilitate designation of sharps waste drop-off sites, the department shall share the name and location of registered pharmacy return programs with jurisdictional health departments and local solid waste management officials.
- (3) A public or private provider of solid waste collection service may provide a program to collect source separated residential sharps waste containers as provided in chapter 70.95K RCW.
- (4) For the purpose of this section, "sharps waste," "sharps waste container," and "pharmacy return program" shall have the same meanings as provided in RCW 70.95K.010. [1994 c 165 § 5.]

NOTES: Findings--Purposes--Intent--1994 c 165: See note following RCW 70.95K.010.

Glossary

Acronyms

DEHP	Di(2-ethylhexyl) phthalate (CAS No [117-81-7], also known as di-octyl phthalate (DOP)
DW	Dangerous waste (hazardous waste)
EtO	Ethylene oxide, a sterilizer
FOG	Fats, Oils and Greases
Hg	Chemical symbol for mercury
JCAHO	Joint Commission on Accreditation of Healthcare Organizations
PBR	Permit-by-Rule
POTW	Publicly owned treatment works
RCRA	Resource Conservation and Recovery Act
SPCC	Spill Prevention, Control, and Countermeasures
TBG	Treatment by Generator
TSD	Treatment Storage and Disposal
TTO	Total Toxic Organics

Definitions

Accumulate	To temporarily store hazardous waste at your place of business for a limited amount of time (180 days if you typically generate between 220 and 2200 pounds of waste per month, 90 days if you generate more).
Acute hazardous waste	Certain listed hazardous wastes or discarded chemical products that are very dangerous and strictly regulated in quantities of more than 2.2 pounds.
Annual report	A yearly summary of your hazardous waste activities submitted to Ecology by March 1 of each year. Required of businesses with RCRA Site Identification Numbers.
Batch	An amount of waste which is generated less frequently than once a month.
Biomedical waste	A Washington State term that includes biohazardous and infectious wastes.
Biohazardous waste	Medical wastes that can include blood, bodily fluid, and/or tissue, as well as materials saturated with blood or bodily fluids.
Characteristics of hazardous wastes	There are four characteristics that can cause a waste to be hazardous: ignitability, corrosivity, reactivity, and toxicity.
Community right-to-know	Title III of the Superfund Amendments and Reauthorization Act (SARA) establishes requirements for government and industry regarding emergency response planning and everyone's right to know about hazardous chemicals in their community. Many hazardous waste generators have requirements under community right-to-know.

Corrosive	A solid or liquid that is a strong acid (pH less than 2), such as battery acid, or a strong caustic (pH greater than 12.5), like drain cleaner (see characteristics).
Criteria waste	Wastes that are hazardous in Washington State because they are toxic or persistent in the environment.
Dangerous waste	Same thing as the federal term “hazardous waste” but with additional “Washington only” wastes, such as criteria wastes. Generators typically become regulated under the <i>Dangerous Waste Regulations</i> when more than 220 pounds are generated per month OR they accumulate more than 2200 pounds on-site at any one time.
Dangerous waste pharmaceuticals	Waste pharmaceuticals that designate as dangerous waste.
<i>Dangerous Waste Regulations</i>	Chapter 173-303 WAC; regulations that implement the state’s Hazardous Waste Management Act and parts of the federal Resource Conservation and Recovery Act.
Dangerous waste sources	Specific and generic operations that create dangerous wastes that are “listed” in the <i>Dangerous Waste Regulations</i> , Chapter 173-303-9904.
Designate	The act of determining whether your wastes are hazardous and if so, why (i.e., are they “listed” waste, characteristic wastes, etc?)
Discarded chemical products	Pure unused products that you intend to dispose of that are regulated as hazardous waste (many pesticides for example). See the list in the <i>Dangerous Waste Regulations</i> , Chapter 173-303-9903.
Empty	Containers are legally empty when less than one inch of waste remains on the bottom or the volume of waste remaining is less than three percent of the container’s total capacity.
Extremely hazardous waste	EHWs are those dangerous wastes that are especially dangerous to the environment and require greater control. Many solvents are EHWs. EHWs cannot be land disposed.
Fully regulated generator	See <i>regulated generator</i> .
Generator	The person, business, or institution that actually produces a hazardous waste. Liability for proper management follows generators from “cradle to grave” from point of generation to final destination.
Hazardous waste (dangerous waste)	The term used by the Environmental Protection Agency to identify those solid wastes with properties that could pose dangers to human health and the environment (i.e., spent solvents, ink sludges, cyanide wastes, etc.).

Ignitable	Liquid wastes with a flashpoint of less than 140° F, such as paint thinner or waste easily capable of causing a fire, such as dirty shop rags (see <i>characteristics</i>).
Land disposal restriction	Federal land disposal restrictions (LDR) restrict wastes from being land disposed unless certain treatment standards or limits have been met. State land disposal restrictions restrict extremely hazardous waste (EHW), such as dry cleaner PERC from land disposal to encourage more favorable management options such as waste reduction, recycling, or treatment.
Legend drugs	Prescription drugs. Drugs that are prescribed for you by your physician and filled at a pharmacy.
Listed wastes	These are regulated hazardous wastes that are listed in the <i>Dangerous Waste Regulations</i> , Chapter 173-303-9903 and -9904. Checking the lists is the first step in designating your waste.
Manifest	A shipping document that accompanies your hazardous waste from point of generation to the final destination. Required of all but small quantity generators and universal waste handlers.
Moderate risk waste	Hazardous waste that is exempt from most state and federal regulations because it is generated in households, or by businesses in quantities typically less than 220 pounds per month. Such businesses are known as small quantity generators.
MSDS	Material Safety Data Sheet, provides health risk information, and what to do in case of exposure or spill. Information can also be helpful in determining if a waste is hazardous. Manufacturers are required by law to provide MSDSs on all products they manufacture and sell.
Notify	State and federal regulations require you to notify Ecology if the amount of hazardous waste you generate per month or batch is more than 220 pounds OR if you accumulate more than 2200 pounds on-site at any one time. 220 pounds is roughly one half of a 55-gallon drum. You can satisfy this requirement by requesting a Site Identification Form, completing it and returning it to Ecology.
Permit-by-rule	Businesses that want to treat wastes on-site to make them less hazardous and/or discharge the treated wastes to the sewer, must notify Ecology by filling out a Site Identification Form and get permission from their sewer authority.
Persistent	Containing greater than the allowable concentrations of certain hydrocarbons. Persistent wastes tend to remain in the environment over long periods of time. For example: metal cutting oil, oil with Freon (see criteria wastes).

QEL	Quantity Exclusion Limits are used to distinguish whether a hazardous waste is subject only to the small quantity generator requirements or the more stringent fully regulated generator requirements. The most common QEL is 220 pounds per month or batch (about one half of a 55-gallon drum). The QEL for some wastes is 2.2 pounds (about a quart).
RCRA	The Resource Conservation and Recovery Act is federal legislation passed in 1976 that initiated regulation of hazardous wastes. Washington State implements parts of RCRA through its <i>Dangerous Waste Regulations</i> .
RCRA Site Identification Number	A unique, 12 character number assigned to generators, transporters, transfer facilities and treatment, storage and disposal facilities. Required for regulated generators and recommended for small quantity generators.
Reactive	A substance that is very unstable, such as metallic sodium, or capable of detonation, such as explosives or picric acid crystals (see characteristics).
Red bag waste	Medical wastes that are saturated with blood or other bodily fluids. Biohazardous waste.
Regulated generator	Or fully regulated generator is typically a business that generates more than 220 pounds per month or accumulates more than 2200 pounds of hazardous waste at any one time. Generators of more than 2200 pounds per month have more requirements than generators of between 220 and 2200 pounds.
Reverse distribution	Unused, outdated or discarded pharmaceuticals are sent back through pharmaceutical redistributors to numerous pharmaceutical manufacturers.
Small quantity generator	Typically, a business (auto repair, printing, etc.) or institution (park, school, etc.) that always generates less than 220 pounds of hazardous waste per month and accumulates less than 2200 pounds of hazardous waste at any one time. Small quantity generators are subject to fewer requirements.
Solid waste	Any material that you no longer use which you either throw away, recycle, or store temporarily until you have accumulated enough to recycle or dispose of it economically.
Special wastes	State-only dangerous wastes in solid form that are corrosive, slightly toxic, and/or persistent but not extremely hazardous, or have polychlorinated biphenyl components (PBCs). These wastes may be disposed of in solid waste landfills if certain requirements are met.
State only dangerous wastes	Dangerous wastes characterized as persistent criteria waste – persistent in the environment (halogenated or polycyclicaromatic hydrocarbons) and/or toxics criteria waste - animal bioassay information and concentration of the toxic components determine the toxic categories (X, A, B, C or D).

Toxic characteristic waste	A substance is toxic if it is poisonous or harmful to plant or animal life. Examples include used antifreeze, paint booth washwater (see criteria waste).
TCLP	A test used to determine if a waste is hazardous under the characteristic of toxicity. The Toxicity Characteristic Leaching Procedure checks for high concentrations of certain heavy metals, organic chemicals and pesticides (see characteristics).
TSD	Treatment, storage and disposal facilities are the final destination of hazardous waste. All TSDs must be permitted and have RCRA Identification Numbers.
Transfer facility	Any transportation related facility including loading docks, parking areas, storage areas, buildings, piers, and other similar areas where shipments of dangerous waste are held, consolidated, or transferred within a period of ten days or less during the normal course of transportation.
Transporter	A person engaged in the off-site transportation of dangerous waste.
Triple rinse	Rinsing a container three times to ensure that it is legally empty. Applies to pesticides and acutely hazardous wastes. Rinse water should be reused in a manner consistent with the original intended purpose.
Worker right-to-know	The Department of Labor and Industries administers worker right-to-know. The rules require all Washington State employers to inform and train employees about hazardous chemicals in the workplace.
Universal waste	Batteries, mercury-containing thermostats and lamps can be managed according to special requirements that are less burdensome than those normally required for fully regulated generators.
Xeriscaping	Landscaping with drought-resistant, native species of plants.
